The Conversion Equation is a no-nonsense guide for business owners to ensure their business gets more prospects, closes more sales, and makes more money immediately. Times have moved on, yet businesses haven't changed their sales and marketing. Buyers are more knowledgeable and the traditional lead generation techniques of direct mail, exhibitions, telemarketing are no longer effective. The days of persuasion selling are gone while 61% of business owners say lead generation is their top challenge. Most businesses are doing marketing all wrong and wasting valuable

time, spending hard-earned money, and using up limited energy on marketing that is not proven and does not work. In The Conversion Equation, best-selling author Dr. Terri Levine shares a proven process that has grown 8 multi-million-dollar businesses for her personally and has helped more than 6,000 business owners worldwide. She shows what is being done wrong in marketing and how to quickly shift to what works that is little known by almost all business owners. The Conversion Equation provides a process that can grow any business in any environment or situation. Terri teaches how to first have the right inner mindset, framework, and beliefs

to generate qualified leads and have them close themselves. She combines her knowledge of human behavior and blends it with her Conversion Equation. The unique approach of this information is why her clients create more income fast.

THE DIGITAL INFORMATION AGE SECOND EDITION by bestselling author Roman Kuc is designed for students considering electrical engineering as a major, and non-engineering majors interested in understanding digital communication systems. Communication between humans and

smart devices takes place through sensors and actuators, with logic circuits manipulating binary data to implement useful tasks. The text then examines the basic problem of communicating audio and video data over a network connecting computers and smart devices. System operation is described from analog-to-digital conversion, signals that encode data, through the processing that extracts data from noise-corrupted signals and error correction techniques, to data packet transmission over wired and wireless networks. Basic topics from probability and digital signal processing are presented as needed and illustrated with relevant examples.

Ideas are illustrated and extended by problems and projects completed in Excel, with sophistication that evolves along with the course, starting with spreadsheet formulas and graphs, through macros, to simple Visual Basic for Applications (VBA) programming that produces animations that simulate system operation. The accrued facility with Excel techniques is a course outcome valued by students in all majors. Important Notice:

Weybrew has developed the ABC model of stress upon a foundation of nearly three decades of stress research with nuclear submariners. With its connotation as a fundamental or elementary principle of stress dynamics, the ABC model is built upon three basic concepts in learning and vector psychology: Antecedent conditions, Behavior, and Consequences. One of the central features of

Weybrew's research is the inclusion of preventive and therapeutic strategies for acute and chronic patterns of stress reactivity. These intervention techniques provided here have heuristic value for the researcher and teacher alike, while being described in language readily understood by the lay reader.
