An Introduction to Aquatic Toxicology is

an introductory reference for all aspects of toxicology pertaining to aquatic environments. As water sources diminish, the need to understand the effects that contaminants may have on aquatic organisms and ecosystems increases in importance. This book will provide you with a solid understanding of aquatic toxicology, its past, its cutting-edge present and its likely future. An Introduction to Aquatic Toxicology will introduce you to the global issue of aquatic contamination, detailing the major sources of

contamination, from where they originate, and their effects on aquatic organisms and their environment. State-of-the-art toxicological topics covered include nanotoxicology, toxicogenomics, bioinformatics, transcriptomics, metabolomics, as well as water management and the toxicological effects of major environmental issues such as algal blooms, climate change and ocean acidification. This book is intended for anyone who wants to know more about the impact of toxicants on aquatic organisms and ecosystems, or to keep up to date with recent and future developments in the field. Provides with the latest perspectives on the impacts of toxicants on aquatic environments, such as nanotoxicology, toxicogenomics, ocean acidification and eutrophication

Offers a complete overview, beginning with the origins of aquatic toxicology and concluding with potential future challenges Includes guidance on testing methods and a glossary of aquatic toxicology terms.

Presents an overview of the complex organs and systems found in the human body, providing information on wellness, ailments, and medical breakthroughs, as well as on how to keep the body healthy and strong.

Reproduction is among the most basic of human biological functions, both for our distant ancestors and for ourselves, whether we live on the plains of Africa or in North American suburbs. Our reproductive biology unites us as a species, but it has also been an important engine of our evolution. In the way our bodies function today we can see both the imprint of our formative past and implications for our future. It is the infinitely subtle and endlessly dramatic story of human reproduction and its evolutionary context that Peter T. Ellison tells in *On Fertile Ground*. Ranging from the latest achievements of modern fertility clinics to the lives of subsistence farmers in the rain forests of Africa, this book offers both a remarkably broad and a minutely

detailed exploration of human reproduction. Ellison, a leading pioneer in the field, combines the perspectives of anthropology, stressing the range and variation of human experience; ecology, sensitive to the two-way interactions between humans and their environments; and evolutionary biology, emphasizing a functional understanding of human reproductive biology and its role in our evolutionary history. Whether contrasting female athletes missing their periods and male athletes using anabolic steroids with Polish farm women and hunter-gatherers in Paraguay, or exploring the intricate choreography of an implanting embryo or of a nursing mother and her child, *On Fertile Ground* advances a rich and deeply satisfying explanation of the mechanisms by which

we reproduce and the evolutionary forces behind their design.

Leading gender and science scholar Sarah S. Richardson charts the untold history of the idea that a woman's health and behavior during pregnancy can have long-term effects on her descendants' health and welfare. The idea that a woman may leave a biological trace on her gestating offspring has long been a commonplace folk intuition and a matter

of scientific intrigue, but the form of that idea has changed dramatically over time. Beginning with the advent of modern genetics at the turn of the twentieth century, biomedical scientists dismissed any notion that a mother—except in cases of extreme deprivation or injury—could alter her offspring's traits. Consensus asserted that a child's fate was set by a combination of its genes and post-birth upbringing. Over the last fifty years, however, this consensus was dismantled, and today, research on the intrauterine environment and its effects on the fetus is emerging as a robust program of study in medicine, public health, psychology, evolutionary biology, and genomics. Collectively, these sciences argue that a woman's

experiences, behaviors, and physiology can have life-altering effects on offspring development. Tracing a genealogy of ideas about heredity and maternal-fetal effects, this book offers a critical analysis of conceptual and ethical issues—in particular, the staggering implications for maternal well-being and reproductive autonomy—provoked by the striking rise of epigenetics and fetal origins science in postgenomic biology today.

Arrival Stories Macmillan

A wide range of women—actors, athletes, academics, CEOs, writers, small-business owners, birth workers, physicians, and activists—share their experiences of becoming mothers in this multifaceted, moving, and revealing collection. Two pink lines on a pregnancy test. The primal scream of a woman

pushing through her thirty-fifth hour of labor. The moment a still-wet newborn is placed in his mother's open arms after an unexpected C-section. The bottomless love reflected in the eyes of a father seeing his daughter for the first time. The moment a baby latches on to her mother's breast. Or the moment that mother decides to switch to formula. Each of these, and so many more, are stories of entering motherhood. Motherhood is an identity, a calling, a battle, a journey. By sharing their experiences, the contributors to *Arrival Stories* offer an informative and deeply affecting account of what it feels like when a woman first realizes she is a mother. This beautiful collection features essays by: Alysia Montaña • Abby G. Lopez • Amber Tamblyn • Shilpa Shah •

Christy Turlington Burns • Emily Oster • Emma Hansen • Leslie Feist • Amanda Williams • Angel Geden • Adrienne Bosh • Latham Thomas • Rachel Feinstein • Ashley Graham • Jill Scott • Jennie Jeddy and Kim DeLise • La La Anthony • Shea Williams • Sienna Miller • Katrina Yoder • Amy Schumer Throughout her difficult pregnancy and following her frightening labor experience, stand-up comedian, actress, writer, producer, and director Amy Schumer found camaraderie and empowerment in hearing birth stories from other women, including those of her friend, activist Christy Turlington Burns. Turlington Burns's work in maternal health began after she experienced a childbirth-related complication in 2003—an experience that would later inspire her to direct and

produce the documentary feature film, *No Woman, No Cry*, about the challenges women face throughout pregnancy and childbirth around the world. Turlington Burns is the founder and CEO of Every Mother Counts, a nonprofit advocacy organization that has invested over \$20 million in programs in Africa, Latin America, South Asia, and the United States. Every Mother Counts works to make pregnancy and childbirth safe, respectful, and equitable for every mother, everywhere. It is through Schumer and Turlington Burns's conversations that the idea for *Arrival Stories* was born. Intimate and urgent, *Arrival Stories* offers a panoramic view of motherhood and highlights the grave injustices that women of color face in maternal healthcare. It is the perfect

book for any expectant or new mother, or for anyone who knows and loves one.

The definitive reference work, this book combines detailed scientific accuracy with a classical style, erudition, and an appealing presentation. It covers the past, present, and future trends in endocrinology, and includes biographies of major figures. It provides chronological tables and name and subject indexes that make the information easily accessible.

Controlling Reproduction Houghton Mifflin

This major new textbook by Jaan Valsiner focuses on the interface between cultural psychology and developmental psychology. Intended for students from

undergraduate level upwards, the book provides a wide-ranging overview of the cultural perspective on human development, with illustrations from pre-natal development to adulthood. A key feature is the broad coverage of theoretical and methodological issues which have relevance to this truly interdisciplinary field of enquiry encompassing developmental psychology, cultural anthropology and comparative sociology. The text is organized into five coherent parts: Part 1: Developmental theory and methodology; Part 2: Analysis of environments for human development Part 3: Cultural organization of pregnancy and infancy; Part 4: Early childhood development; and Part 5: Entering the world of activities -

culturally ruled.

This book will emphatically argue that human beings and chimpanzees have never shared a common ancestor, nor did humans undergo evolution or microevolution. Moreover, this book will discuss the serious mistakes and misleading guidance the book published by NAS- National Academy of Sciences, "Science, Evolution, and Creationism" makes. Their argument that human

beings and chimpanzees share a common ancestor is wrong without any scientific basis. They also claim that the Theory of Evolution is “the cornerstone of modern sciences”. However, the facts shown by DNA codes proved that the Theory of Evolution is wrong. Based on a wrong viewpoint as the cornerstone, NAS suppresses and impedes the development of science. NAS members are leaders in American sciences. Therefore, they have to bear the necessary responsibility. Modern science has determined that hereditary information of all living species is totally defined by its own DNA coding sequences. Unique DNA codes define a unique species. The overall DNA coding sequences keep high fidelity during the genetic breeding of various species,

thereby helping scientists find sources of any species. Since biological features of all species depend on their own DNA codes, DNA codes must be the only correct direction and method for understanding the origin of species.

Reflections on how physical appearance, and beliefs about it, affect women’s lives from a #1 bestselling author who’s “enormously fun to read” (The New York Times). Beauty and appearance play a pervasive role in our culture. Here, the #1 New York Times-bestselling author of the groundbreaking, controversial bestseller *My Secret Garden* delves into beauty's influence on popular media and the psyche of modern women.

Combining in-depth cultural analysis

with personal anecdotes, sexology, and individual case studies, Nancy Friday explores the dissatisfaction women feel about their bodies—and how it affects their sexual freedom. Her analysis is broad-reaching, examining how popular culture, advertising, stereotypes of women in the workplace, the sexual liberation of the 1960s, and the dynamics of family relationships put pressure on women to live up to an impossible feminine ideal. Crustaceans are increasingly used as model organisms in all fields of biology, as few other taxa exhibit such a variety of body shapes and adaptations to particular habitats and environmental

conditions. *Life Histories* is the fifth volume in *The Natural History of the Crustacea* series. An understanding of life histories is crucial to understanding the biology of this fascinating invertebrate group. Written by internationally recognized experts studying a wide range of crustacean taxa and topics, this volume synthesizes current research in a format that is accessible to a wide scientific audience. Remembering Maternal Bodies is a collection of essays about the writings of several Latina and Latin American women writers who remember their mothers, and/or challenge our commonly held beliefs about motherhood and maternity, in an effort to stop depression

and melancholy. It suggests that the widespread violent depression and sometimes suicidal melancholy that haunts our culture and society is the result of a terrible fantasy about the way we become ourselves. This fantasy has a matricide at its core, and this matricide will continue to have its depressing effect on us as long as it remains in place and invisible. The authors showcased in this book make visible this fantasy and change it in their works in an effort to bring us out of our depression and melancholy.

The American Matisse Rosetta Books Epigenetics and Reproductive Health, a new volume in the Translational Epigenetics series, provides a thorough overview and discussion of epigenetics in reproduction and implications for

reproductive medicine. Twenty international researchers discuss epigenetic mechanisms operating during the formation of male and female gametes, fertilization and subsequent embryo and placental development, particularly in mammals and transgenerational epigenetic inheritance. This volume also addresses aberrant epigenetic changes influencing male and female infertility, pregnancy related disorders, and those potentially linked to therapeutic manipulations and assisted reproductive technologies. Emphasis is placed on identifying biomarkers for early detection of aberrant epigenetic mechanisms. Later chapters examine the possibility of correcting these epigenetic dysfunctions, as well as current challenges and next steps in

research, enabling new translational discoveries and efforts towards developing therapeutics. Thoroughly examines the influence of aberrant epigenetics during gametogenesis and embryogenesis, affecting parents, gametes and embryos, offspring and future generations Explores health outcomes for reproductive senescence, endocrine disruption, testicular cancer, prostate cancer, breast cancer, ovarian cancer, endometrial cancer and cervical cancers Features chapter contributions from international researchers in the field

During the past quarter century, there has been a tremendous expansion in our knowledge about gastropods, their

behavior and their neurobiology. We can understand a great deal about mammalian nervous systems by studying the relatively larger and simpler structure of the gastropod nervous system. Behavior and Its Neural Control in Gastropod Molluscs first reviews the broader aspects of molluscan biology and draws attention to the special features of the gastropod nervous system. The book then examines different types of behavior, reviewing progress in understanding the mechanisms of neural control, and emphasizing cases in which control can be attributed to identified neurons and identified neural circuits.

Quinn never expected that her best

friend's courageous decision to be a single mother by choice would end up transforming her own life in this poignant novel from USA Today bestselling author Robin Wells. When Quinn Langston's best friend unexpectedly passes away, Quinn embraces Brooke's three-year-old daughter Lily and elderly grandmother Margaret as the family she's always wanted. She'll do whatever it takes to help them heal, but she didn't anticipate Lily's biological father would be part of the plan. Margaret is old-fashioned, though, and she has no compunction about finding a way to reach Lily's dad, a sperm donor. After all, he's a blood

relative, and she believes family should raise family. Zack Bradley doesn't know what to expect when he finds out he has a child. Sperm donors don't usually get to meet their...well, he's not sure what to call Lily yet, but he's certain he wants to get to know her. There's just one of problem: he's about to move to Seattle with his wife, Jessica, who's undergone multiple infertility treatments, desperately wants a family of her own and can't stand the idea of Zack playing daddy to another woman's child. Together, they'll all learn that the human heart is infinitely expandable and there are many different roads to family.
