Carbon Capture and Storage (CCS) is increasingly viewed as one of the most significant ways of dealing with greenhouse gas emissions. Critical to realising its potential will be the design of effective legal regimes at national and international level that can handle the challenges raised but without stifling a

new technology of potential great public benefit. These include: long-term liability for storage; regulation of transport; the treatment of stored carbon under emissions trading regimes; issues of property ownership; and, increasingly, the sensitivities of handling the public engagement and perception. Following its publication in 2011, Carbon Capture and Storage quickly became required reading for all those interested in, or engaged by, the need to implement regulatory approaches to CCS. The intervening years have seen significant developments

globally. Earlier legislative models are now in force, providing important lessons for future legal design. Despite these developments, the growth of the technology has been slower in some jurisdictions than others. This timely new edition will update and critically assess these updates and provide context for the development of CCS in 2018 and beyond. *A Report to Parliament by the Minister of Energy* Frontiers Media SA
The North Sea, one of the most intensively used sea-areas in the world, may well be one of the most intensively regulated sea-

areas as well. As human activity developed in the North Sea national and later international regulations followed these developments. The result has been what is commonly called a piecemeal approach. The legal regime of the North Sea has developed in an incremental manner. Thus one conventional instrument after the other, covering different user-functions like vessel-source pollution, fisheries, ocean dumping and land-based pollution, was adopted. In contrast to more modern approaches these legal instruments have their own framework. The result is that the instruments are scattered in many different documents, and even for the more well informed North Sea watcher it is difficult to obtain a comprehensive overview of the regulatory instruments. "The North Sea: Basic Legal Documents on Regional Environmental "Co-operation" offers a comprehensive view of the instruments dealing with all sources of marine pollution in the North Sea, be they ocean dumping, land-based pollution or vessel-source pollution. The book contains many legal documents, including maps and tables. It also contains non-conventional instruments such as the

texts of the declarations of the International North Sea Conferences, held between 1984 and 1990, and recommendations and decisions of e.g. the Paris Commission on Land-Based Pollution and the Oslo Commission on Dumping. Furthermore the book contains documentation on relatively new areas of environmental concern in the North Sea region, i.e. nature conservation and management of living resources. The book supplements "The North Sea: Perspectives on Regional" "Environmental Co-operation" also edited by David Freestone and Ton IJlstra which contains 26 essays on legal and policy aspects of environmental protection in the North Sea.

The objective of the book is to provide all the elements to evaluate the performance of production availability and reliability of a system, to integrate them and to manage them in its life cycle. By the examples provided (case studies) the main

target audience is that of the petroleum industries (where I spent most of my professional years). Although the greatest rigor is applied in the presentation, and justification, concepts, methods and data this book is geared towards the user.

Challenges at the Cutting Edge Production Availability and Reliability Use in the Oil and Gas industry

The world is on the verge of an unprecedented increase in the production and use of biofuels for transport. The combination of rising oil prices, issues of security, climate instability and pollution, deepening poverty in rural and agricultural areas, and a host of improved technologies, is propelling governments to enact powerful incentives for the use of these fuels, which is in turn sparking investment. Biofuels for Transport is a unique and comprehensive assessment of the opportunities and risks of the large-scale production of biofuels. The book demystifies complex questions and concerns, such as the **food v. fuel** debate. Global in scope, it is further informed by five country studies from Brazil, China, Germany, India and Tanzania. The authors conclude that

biofuels will play a significant role in our energy future, but warn that the large-scale use of biofuels carries risks that require focused and immediate policy initiatives. Published in association with BMELV, FNR and GTZ.

Physical Modelling in Geotechnics collects more than 1500 pages of peer-reviewed papers written by researchers from over 30 countries, and presented at the 9th International Conference on Physical Modelling in Geotechnics 2018 (City, University of London, UK 17-20 July 2018). The ICPMG series has grown such that two volumes of proceedings were required to publish all contributions. The books represent a substantial body of work in four years. Physical Modelling in Geotechnics contains 230 papers, including eight keynote and themed lectures representing the state-of-the-art in physical modelling research in aspects as diverse as fundamental modelling including sensors, imaging, modelling techniques and scaling, onshore and offshore foundations, dams and embankments, retaining walls and deep

excavations, ground improvement and environmental engineering, tunnels and geohazards including significant contributions in the area of seismic engineering. ISSMGE TC104 have identified areas for special attention including education in physical modelling and the promotion of physical modelling to industry. With this in mind there is a special themed paper on education, focusing on both undergraduate and postgraduate teaching as well as practicing geotechnical engineers. Physical modelling has entered a new era with the advent of exciting work on real time interfaces between physical and numerical modelling and the growth of facilities and expertise that enable development of so called 'megafuges' of 1000gtonne capacity or more; capable of modelling the largest and most complex of geotechnical challenges. Physical Modelling in Geotechnics will be of interest to professionals, engineers and academics interested or involved in geotechnics, geotechnical engineering and related areas. The 9th International Conference on Physical Modelling in Geotechnics was organised by the Multi Scale Geotechnical

Engineering Research Centre at City, University of London under the auspices of Technical Committee 104 of the International Society for Soil Mechanics and Geotechnical Engineering (ISSMGE). City, University of London, are pleased to host the prestigious international conference for the first time having initiated and hosted the first regional conference, Eurofuge, ten years ago in 2008. Quadrennial regional conferences in both Europe and Asia are now well established events giving doctoral researchers, in particular, the opportunity to attend an international conference in this rapidly evolving specialist area. This is volume 2 of a 2-volume set.

This significantly updated second edition of a classic work on the subject identifies the issues and constraints for each stage

in the production of petroleum products – what they are, who is imposing them and why, their technical and financial implications. It then looks in detail at the technological solutions which have been found or are being developed. It also places these developments in their legal and commercial context.

This book considers the uses of membrane technology in the chloralkali, water, food and biotechnology industries where the major effect of the technology is an improvement in product quality often allied to a saving in energy consumption. It also covers the implications for the power generation, oil and gas industries. The United Kingdom ... review CRC Press Navigating the regulatory frameworks which apply to oil and gas projects around the world can be a complex challenge, particularly as industry investors continue to develop resources further and further afield. Written by experts from leading law firms across the world, *Oil & Gas - A comparative guide to the regulation of oil and gas projects*, provides a comprehensive comparative guide to the

regulation of oil and gas projects in 17 key oil and gas producing jurisdictions of our time. It serves as an essential starting reference for understanding the vital elements of oil and gas regulation in those jurisdictions, covering licensing and approvals regimes, state participation rights, foreign investment restrictions, land access, taxation, environment, safety and much more.

Gas Prices in the UK Stationery Office Whilst the UK economy must decarbonise if the country is to meet its obligations to tackle climate change, and use of fossil fuels must diminish, the UK will still need to use the oil and gas resources remaining in the UK continental shelf.

This issue of the Digest of United Kingdom Energy Statistics (DUKES) is part of a series and updates the figures given in the Department for Business, Enterprise & Regulatory Reform's (BERR) DUKES 2008. The publication consists of seven chapters; the first chapter deals with overall energy, with the other chapters covering specific fuels, combined heat and power and renewable sources of energy. The

statistics presented in this digest will generate widespread interest from anyone working within or with an interest in energy sources, consumption and climate change. Chapters covering specific fuels and renewable sources of energy contain details on the production and consumption of individual fuels, presented using commodity balances. A commodity balance illustrates the flow of a fuel through from production to final consumption. These individual commodity balances are also combined in an energy balance, showing the interaction between different fuels. General energy statistics are presented in a table, revealing energy consumption by final users and an analysis of energy consumption by main industrial groups. Surveys conducted by AEA Energy & Environment on behalf of DECC estimate the contribution made by combined heat and power and renewable energy to energy production and consumption in the UK.
