CI/ASCE Standard

38-02 presents a credible system for classifying the quality of utility location information that is placed in design plans. The Standard addresses issues such as: how utility information can be obtained, what

technologies are available to obtain that information; how that information can be conveyed to the information users; who should be responsible for typical collection and depiction tasks; what factors determine which utility quality level attribute to assign to data; and what the relative costs and benefits of the various quality levels are. Used as a reference or as part of a specification, the Standard will assist engineers, project and utility owners, and constructors in developing strategies to reduce risk by improving the reliability of information on existing subsurface utilities in a defined manner.

"This is a mood book, concise in its information and lavish in its photography. It celebrates the sensual qualities and vivid beauty that add up to the tropical architecture of one of the culturally richest regions in the world. In the current literature on architecture, "Tropical Architecture and Interiors" is one of

the very few that documents the splendid range of elegantly conceived buildings and remarkable interiors in Southeast Asia. You will find gathered together some of the most charming works by talented architects and designers."--Dust jacket.

This new addition to the Step-Up series uses a case-based format to parallel the manner in which interns learn and the thought processes interns employ when seeing a patient. Each case presentation includes a work-up, diagnosis, and treatment. Each case presentation also includes a discussion of the multiple medical problems possible and the reason why they are or are not a component of the final diagnosis. The content focuses on subjects most commonly tested on the USMLE Step 3. Quick Hits, buzzwords, mnemonics, acronyms, and lists are used throughout the text. To achieve goals for climate and economic growth, "negative emissions technologies" (NETs) that remove and sequester carbon dioxide from the air will need to play a significant role in mitigating climate change. Unlike carbon capture and storage technologies that remove carbon dioxide emissions directly from large point sources such as coal power plants, NETs remove carbon dioxide directly from the atmosphere or enhance natural

carbon sinks. Storing the carbon dioxide from NETs has the same impact on the atmosphere and climate as simultaneously preventing an equal amount of carbon dioxide from being emitted. Recent analyses found that deploying NETs may be less expensive and less disruptive than reducing some emissions, such as a substantial portion of agricultural and land-use emissions and some transportation emissions. In 2015, the National Academies published *Climate Intervention: Carbon Dioxide Removal and Reliable Sequestration*, which described and initially assessed NETs and sequestration technologies. This report acknowledged

the relative paucity of research on NETs and recommended development of a research agenda that covers all aspects of NETs from fundamental science to full-scale deployment. To address this need, *Negative Emissions Technologies and Reliable Sequestration: A Research Agenda* assesses the benefits, risks, and "sustainable scale potential" for NETs and sequestration. This report also defines the essential components of a research and development program, including its estimated costs and potential impact.
