Unique organization begins with an introduction to the basic information and topics pertinent to children of all ages, then divides up the rest of the text by age group to cover the specific changes the child experiences physically, cognitively, emotionally, and socially. In most cases, particular dental issues are discussed only once, at the point in a child's development at which they are most appropriate. Section on children from conception to age three covers conditions such as cleft palate, disturbances in calcification, unusual numbers of teeth, oral habits, caries, and the development of malocclusions that start during these years. Chapter on aesthetic restorative dentistry for the adolescent looks at material selection, tooth color and form, diastemas, discolored teeth, bleaching and more. Chapter on sport dentistry and mouth protection covers how to evaluate child/adolescent athletes, the different types of mouth protection available, and professional activities in sports dentistry. Chapter on the diagnosis of oral lesions and developmental anomalies uses tables and extensive illustrations to depict developmental anomalies, white soft tissue lesions and enlargements, dark soft tissue lesions, ulcerative lesions, radiolucent lesions of bone, mixed radiolucent and radiopaque lesions of bone.

Paediatric Dentistry Butterworth-Heinemann

This book is a comprehensive guide to pediatric dental fear/anxiety (DFA) and phobia that will provide practitioners with a full understanding of the etiology, prevalence, assessment, and management of these conditions. The coping styles of children when under stress are explored, with discussion of their relevance to the assessment visit and treatment allocation. Practical treatment techniques are comprehensively covered, from non-pharmacological behavioral strategies relevant for children with no or mild DFA to those approaches more appropriate for children with severe DFA/phobia. The importance of the use of language and communication skills to build rapport and allay anxiety is explored. Relaxation and hypnosis techniques are described, with guidance on how to introduce these to patients and their parents/carers. Techniques that help children cope when receiving injections are detailed, including systematic needle desensitization; these provide practitioners with options to help resolve DFA and phobia regarding needles. Intravenous sedation, including the challenge of cannulation, is covered comprehensively. Furthermore, cognitive behavioral therapy is presented, with suggestion of practical self-help material when appropriate. The closing chapter looks to the future, discussing the barriers to and the changes required for the creation of more child-centered DFA services.
