Special Relativity Special relativity is a theory proposed by Albert Einstein that describes the propagation of matter and light at high speeds. It was invented to explain the observed behavior of electric and magnetic fields, which it beautifully reconciles into a single so-called electromagnetic field, and also to resolve a number of paradoxes. Special Relativity -- from Eric Weisstein's World of Physics We have now reviewed the developments in the physics of moving bodies, of light, of

electricity and magnetism that brought the physics that Einstein found when he began to think about ether, electricity, magnetism and motion. It was pondering these developments that led Einstein to discover the special theory of relativity in 1905. Einstein's Pathway to Special Relativity In developing special relativity, Einstein began by accepting what experiment and his own thinking showed to be the true behaviour of light, even when this contradicted classical physics or the usual perceptions about the world. The fact that the speed of light is the same for all observers is inexplicable in ordinary

terms.
