Filter Design for Signal Processing Using MATLAB and ... Filtering is a class of signal processing, the defining feature of filters being the complete or partial suppression of some aspect of the signal. Most often, this means removing some frequencies or frequency bands. Filter (signal processing) - Wikipedia Digital filters are central to almost every signal processing system. Filters eliminate unwanted artifacts from signals to enhance their quality and prepare them for further processing. Digital filters are used in a variety of signal processing tasks including outlier and noise removal, waveform shaping, signal smoothing, and signal recovery.
