In developing and transition economies, 60 to 80 percent of all passenger and freight transport moves by road—the main form of access for most rural communities. Yet most of the 11 million kilometers of roads in these economies are badly maintained and poorly managed. This paper discusses one of the most effective ways to promote sound policies for managing and financing road networks—commercialization. It discusses the emerging central concept of bringing roads into the marketplace, putting them on a fee-for-service basis, and managing them like a business.

finance problems. Second, we bring in established financial concepts and show how shareholder wealth maximization can be modeled under the constraints imposed by institutions, ethics, resources, etc.

Modern Working Capital Management Cognella Academic Publishing

Focused on real-life decision making in an international context, this text demystifies and simplifies multinational financial management in a clear, conceptual framework. "Do you really understand what business value is? Information technology can and should deliver business value. But the Agile literature has paid scant attention to what business value means—and how to know whether or not you are delivering it. This problem becomes ever more critical as you push value delivery toward autonomous teams and away from requirements "tossed over the wall" by business stakeholders. An empowered team needs to understand its goal! Playful and thought-provoking, *The Art of Business Value* explores what business value means, why it matters, and how it should affect your software development and delivery practices. More than any other IT delivery approach, DevOps (and Agile thinking in general) makes business value a central concern. This book examines the role of business value in software and makes a compelling case for why a clear understanding of business value will change the way you deliver software. This book will make you think deeply about not only what it means to deliver value but also the relationship of the IT organization to the rest of the enterprise. It will give you the language to discuss value with the business, methods to cut through bureaucracy and strategies for incorporating Agile teams and culture into the enterprise. Most of all, this book will startle you into new ways of thinking

about the cutting-edge of Agile practice and where it may lead."

Assessing Public Safety and Security Measures at Nuclear Power Facilities : Hearing Before the Subcommittee on National Security, Emerging Threats and International Relations of the Committee on Government Reform, House of Representatives, One Hundred Eighth Congress, First Session, March 10, 2003 World Bank Publications

Seminar paper from the year 2004 in the subject Business economics - Investment and Finance, grade: 85%, Stellenbosch University, 21 entries in the bibliography, language: English, abstract: The financing strategy is the mix of capital chosen by each enterprise. This strategy is of extreme importance, because it can have a profound effect on the value of the enterprise. In general, firms have different possibilities to design its capital structure. Debt can be issued in a large quantity or only in a small amount. Furthermore, warrants, convertible bonds, caps, callers or preferred stock can be issued. Firms can use lease financing, bond swaps or forward contracts. The variations in capital structures are infinite, due to the endless number of financing instruments. Variables such as demand and supply, the capital requirement, the price of capital

(interest rates), types of security, etc. are given at a particular point in time. We will discuss how a firm should finance in order to establish an optimal combination of equity and debt capital in the interests of the welfare of the owners. Uncertainty and risk are central to the financing problem and therefore financing must in essence be dynamic by nature. The single most important basis for making any financial decision is prognosis. The techniques used are mainly those of budgets and analysis by means of ratios. Prognosis, income expectations and developments in the money and capital markets, play a central role as the single most important basis of each financing decision. The optimal combinations of equity capital and debt to maximise the interest of the owners, are achieved by means of the sensible use of debt. The question thus arises to what extent this approach can be utilised and therefore the determining factors of the financial structure must be considered in more detail. This paper will focus on these factors. It will not discuss sources of financing in detail, which should be treated as a separate topic.
