 Durable commodities are the raw products from which food can be made and are the staples on which most humans rely; with but a few exceptions they are the seeds of plants. Volume 1 of this ground-breaking book series (details below) explains how crops should be dried, handled, protected from pests and stored by smaller holders or large-scale enterprises. This second volume presents a series of case studies on how durable crops are actually stored and marketed. The compilation of this three-volume work has been supported and is endorsed by the Natural Resources Institute of the University of Greenwich, U.K. The

editors of this comprehensive and thorough book are well known and respected in the world of post-harvest science and technology. They have drawn together 36 expert contributors from Europe, North America, Asia, Australasia, South America and Africa to provide a huge wealth of information on major world crops including rice, maize, wheat, barley, sorghum, beans, cowpea, oilseeds, peanuts, copra, coffee, cocoa, dried fruit and nuts, and dried fish. Crop Post Harvest, Volume 2 is an essential purchase for cereal technologists, food scientists and technologists, agricultural scientists, entomologists, post-harvest crop protection specialists and consultants, commercial growers, shippers and warehousing operatives, and personnel of packaging companies. Researchers and upper-level students in food science, food technology, post-harvest science and technology, crop protection, applied biology, and plant and agricultural sciences will find a huge amount of great use within this landmark publication and the three-volume series as a whole. All libraries in research establishments and universities where these subjects are studied and taught should have several copies

of each on their shelves.

The International Year of Fruits and Vegetables 2021 (IYFV), as declared by the UN General Assembly in Resolution A/RES/74/244, aims at raising awareness of, directing policy attention to, and sharing good practices on the nutritional and health benefits of fruit and vegetable consumption, the contribution of fruit and vegetable consumption to the promotion of diversified, balanced and healthy diets and lifestyles, and reducing loss and waste of fruits and vegetables. This background paper outlines the benefits of fruit and vegetable consumption, but also examines the various aspects of the fruit and vegetable sector from a food systems approach: from sustainable production and trade to loss and waste management. This paper provides an overview of the sector and a framework and a starting point for discussion for the Year, highlighting the interlinkages of stakeholders and key issues to be considered for action during the IYFV.

Modern Methods of Plant Analysis When the handbook Modern Methods of Plant Analysis, was first introduced in 1954, the considerations were: 1. the dependence of scientific progress in biology on the improvement of existing and the introduction of new methods; - 2. the difficulty in finding many new analytical methods in specialized journals which are normally not accessible to experimental plant biologists; 3. the fact that in the methods sections of papers the description of methods is frequently so compact, or even sometimes to incomplete, that it is difficult to reproduce experiments. These considerations still stand today. The series was highly successful, seven volumes appearing between 1956 and 1964. Since there is still today a demand for the old series, the publisher has decided to resume publication of

Modern Methods of Plant Analysis. It is hoped that the New Series will be just as acceptable to those working in plant sciences and related fields as the early volumes undoubtedly were. It is difficult to single out the major reasons for the success of any publication, but we believe that the methods published in the first series were up-to-date at the time and presented in a way that made description, as applied to plant material, complete in itself with little need to consult other publications. Contribution authors have attempted to follow these guidelines in this New Series of volumes. Editorial The earlier series of Modern Methods of Plant Analysis was initiated by Michel v.

The first handbook of its kind, giving in one volume, etailed information on both the analysis and quality control of fruit and vegetable products. Authoritative, need-based and up-to-date, the book has been principally designed to meet the day-to-day requirements. Starting from the analysis of common constituents, the book covers methods of analysis of specific raw materials and containers used in processing measurement of different quality attributes, sensory evaluation, microbiological and microanalytical examinations, determination of thermal process time, and examination of specific fruit and vegetable products. The last few chapters are devoted to statistical quality control, preparation of standard solutions and tables required for day-to-day use. Sufficient theoretical information is included in each chapter before the methods are described. Each method is self-contained, easy to follow, time-tested and complete in all respects. Wherever needed, reference values or standards-PFA, ISI or FAO/WHO Codex Alimentarius are given. With its comprehensive coverage and up-to-date information, the book would be useful to public analysts, factory personnel, processors, research workers, and students of food science, food technology, agriculture and home science.
