Probability Markov Chains Queues And

Numerous queueing models use continuous-time Markov chains.
 For example, an M/M/1 queue is a CTMC on the non-negative
 integers where upward transitions from i to $i + 1$ occur at rate λ
 according to a Poisson process and describe job arrivals, while
 transitions from i to $i - 1$ (for $i > 1$) occur at rate μ (job service
 times are exponentially distributed) and describe completed
 services (departures) from the queue.

The M/M/1 queue and its extensions to more general birth-death
 processes are analyzed in detail, as are queues with phase-type

arrival and service processes. The M/G/1 and G/M/1 queues are solved using embedded Markov chains; the busy period, residual service time, and priority scheduling are treated. Open and closed queueing networks are analyzed.
