Getting the right diagnosis is a key aspect of health care - it
provides an explanation of a patient's health problem and informs
subsequent health care decisions. The diagnostic process is a
complex, collaborative activity that involves clinical reasoning and
information gathering to determine a patient's health problem.
According to *Improving Diagnosis in Health Care*, diagnostic
errors-inaccurate or delayed diagnoses-persist throughout all
settings of care and continue to harm an unacceptable number of
patients. It is likely that most people will experience at least one
diagnostic error in their lifetime, sometimes with devastating
consequences. Diagnostic errors may cause harm to patients by
preventing or delaying appropriate treatment, providing
unnecessary or harmful treatment, or resulting in psychological or
financial repercussions. The committee concluded that improving

the diagnostic process is not only possible, but also represents a
moral, professional, and public health imperative. *Improving
Diagnosis in Health Care* a continuation of the landmark Institute
of Medicine reports *To Err Is Human* (2000) and *Crossing the
Quality Chasm* (2001) finds that diagnosis-and, in particular, the
occurrence of diagnostic errors"has been largely unappreciated
in efforts to improve the quality and safety of health care. Without
a dedicated focus on improving diagnosis, diagnostic errors will
likely worsen as the delivery of health care and the diagnostic
process continue to increase in complexity. Just as the diagnostic
process is a collaborative activity, improving diagnosis will require
collaboration and a widespread commitment to change among
health care professionals, health care organizations, patients and
their families, researchers, and policy makers. The
recommendations of *Improving Diagnosis in Health Care*
contribute to the growing momentum for change in this crucial
area of health care quality and safety.
