This book presents multiple new and classical methods for studying the vital poly-ADP-ribose (pADPr) pathway. Beginning with techniques for the detection and quantification of the product of poly(ADP-ribose) polymerase (PARP) enzymatic activity and detection of variation in pADPr production during the cell cycle, the volume continues with sections on the identification of pADPr protein acceptors, methods focusing on studying molecular mechanisms of PARP functions in eukaryotic cells, particularly those involved in control of DNA repair and oxidative stress, as well as in

expression regulation, approaches to the in vitro reconstitution of PARP-1 interaction with chromatin, the development and testing of small molecule PARP inhibitors, and the functions of understudied members of PARP family. Written for the highly successful Methods in Molecular Biology series, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Authoritative and practical, Poly(ADP-Ribose) Polymerase: Methods and Protocols, Second Edition serves as an ideal companion to the first edition for scientists whose investigations involve this important pathway. It appears that a comprehensive and up-to-date book on the impact of virus diseases on the major crops in developing countries is now much needed, especially as there have been rapid advances in the biological and molecular characterization and detection of the pathogens and possible approaches for their control. On the other hand, the economic losses caused by many of these diseases are tremendous and much of the accumulated knowledge to diminish the crop losses has not filtered through, or cannot be applied. This book is focused on the important crops. Each chapter on a specific crop will include inter alia, geographical distribution, the viruses - symptoms, damage, detection - a brief description of the viruses concerned,

and present and future ways for their control. Experts from India, Nigeria, UK, USA, France, Germany, Peru, Japan, Australia, Netherlands, Venezuela, Kazakhstan and Israel (many of them from the International Research Institutions) have contributed chapters to this book.

This book collects the most effective and cutting-edge methods and protocols for deriving and culturing human embryonic and adult stem cells—in one handy resource. This groundbreaking book follows the tradition of previous books in the Culture of Specialized Cells Series—each methods and protocols chapter is laid out exactly like the next, with stepwise protocols, preceded by

specific requirements for that protocol, and a concise discussion of methods illustrated by data. The editors describe a limited number of representative techniques across a wide spectrum of stem cells from embryonic, newborn, and adult tissue, yielding an all-encompassing and versatile guide to the field of stem cell biology and culture. The book includes a comprehensive list of suppliers for all equipment used in the protocols presented, with websites available in an appendix. Additionally, there is a chapter on quality control, and other chapters covering legal and ethical issues, cryopreservation, and feeder layer culture. This text is a one-stop resource for all researchers, clinical scientists, teachers, and students involved in this crucial area of study.
