Discusses nine assessment issues that are grouped into three major areas: assessing the decision to pursue Business Process Reengineering (BPR), focuses on strategic & general management issues that need to be resolved before an organization embarks on a BPR project. Assessing the new process' development picks up at the point where the organization has decided to begin a BPR project. It focuses on the management of the BPR team, the team's process redesign activities, & the business case it develops. Assessing project implementation & results deals with the problems involved in piloting & deploying a new BPR. Glossary & bibliography.

Businesses must constantly adapt to a dynamically changing environment that requires choosing an adaptive and dynamic information architecture that has the flexibility to support both changes in the business environment and changes in technology. In general, information systems reengineering has the objective of extracting the contents, data structures, and flow of data and process contained within existing legacy systems in order to reconstitute them into a new form for subsequent implementation. Information Systems Reengineering for Modern Business Systems: ERP, Supply Chain and E-Commerce Management Solutions covers different techniques that could be used in industry in order to reengineer business processes and legacy systems into more flexible systems capable of supporting modern trends such as Enterprise Resource Planning (ERP), supply chain management systems and e-commerce. This

reference book also covers other issues related to the reengineering of legacy systems, which include risk management and obsolescence management of requirements.

With the massive increase in interest in BPR, TQM and ISO 9000 has come a tide of texts and evangelical razzamatazz on the philosophy and the hearts and minds issues. But those tasked with making change happen at the coal face must feel short of practical tools to work with when it comes to modelling and analysing the business processes that are to be re-engineered, improved or defined. This book provides an answer. Why worry about processes? People know that organisations have functions and responsibilities but not everyone will see these as part of the process. Each person does their bit, but how do all the pieces fit together? Starting people to think about processes and simply modelling the processes can provide individuals and groups with a perspective which transcends parochial views and results in a more collaborative spirit; "now I know what you want I can ensure you get it reliably". A model that makes the process visible to all concerned brings great value in itself. Business Processes is intended to help people "get out of the functional silos". What is STRIM? STRIM-A Systematic Technique for Role & Interaction Modelling-and its central notation-The Role Activity Diagram-provides a practical method for really getting to grips with what the organisation does and how it does it, in a way which is revealing, communicative, and accessible by everyone around the organisation. The book covers the full method: from organising a modelling project, through the notation, its use at micro and macro levels, patterns of organisational behaviour, through process analysis and on into process support system development.

After a brief introduction to the topic of business process modeling, the book offers a quick-start into model-based business process engineering. After that, the foundations of the modeling languages used are conveyed. Meaningful examples are in the foreground - each of the underlying formalisms is treated only as far as needed. Next the Horus Method is described in detail. The

book defines a sequence of activities which finally leads to the creation of a complete business process model. The Horus Method, incidentally, is not bound to the use of the Horus software tools. It can be used with other tools or, if necessary, be used even without tool support. Important application fields of business process engineering are described, where the spectrum ranges from business process reengineering to the development and implementation of information systems. The book concludes with an outlook on the future of business process engineering and highlights current research activities in the area.

Most managers will by now have some understanding of Business Process Re-Engineering and the immense benefits it is capable of bringing. Here at last is a detailed guide to realizing those benefits. The authors begin with a warning to think carefully about whether the BPR approach is suitable for your particular organization. They go on to show how it can be planned and implemented in a systematic way. With the aid of examples and illustrations they take the reader through the various stages involved, introducing both the principles and the techniques that apply. Finally they explain how to ensure sustained improvement by managing the changes achieved.

One of the keys to successful business process engineering is tight alignment of processes with organisational goals and values. Historically, however, it has always been difficult to relate

different levels of organizational processes to the strategic and operational objectives of a complex organization with many interrelated and interdependent processes and goals. This lack of integration is especially well recognized within the Human Resource Management (HRM) discipline, where there is a clearly defined need for greater alignment of HRM processes with the overall organizational objectives. Value-Focused Business Process Engineering is a monograph that combines and extends the best on offer in Information Systems and Operations Research/Decision Sciences modelling paradigms to facilitate gains in both business efficiency and business effectiveness.

Systems Engineering for Business Process Change OUP Oxford
A business organization, like a human body, is only as effective as its various processes. Pretty obvious, right? Yet, as V. Daniel Hunt demonstrates in this groundbreaking book, the failure to appreciate this obvious fact is the reason most reengineering schemes fail. Managers whose job it is to improve company performance, like physicians who work to improve patient health, must develop a clear picture of how each process fits into the overall organizational structure; how it ought to function; and how well it is performing at any given moment; before they can form a diagnosis or devise a treatment strategy. Fortunately, a powerful new analytical tool that has emerged in recent years helps you to do all of that and much more. Developed at General Electric, process mapping has been implemented in companies around the globe, and the results have been simply astonishing. Now find out how to make this breakthrough reengineering technology work for your organization in *Process Mapping*. The first and only hands-on guide of its kind, *Process Mapping* arms you with a full complement of state-of-the-art tools and techniques for assessing existing business processes and developing a detailed road map for ongoing change and improvement. Organizational Transformation Through Business Process Reengineering John Wiley & Sons

Business processes and information systems mutually affect each other in non-trivial ways. Frequently, processes are designed without taking the systems' impact into account, and vice versa. Missing alignment at design-time results in quality problems at run-time. Robert Heinrich gives examples from research and practice for an integrated design of process and system quality. A quality reference-model characterizes process quality and a process notation is extended to operationalize the model. Simulation is a powerful means to predict the mutual quality impact, to compare design alternatives, and to verify them against requirements. The author describes two simulation approaches and discusses interesting insights on their application in practice.

Since its first edition 15 years ago, *Business Process Analysis* has become a standard reference work in the library of many business process practitioners. This new edition continues the presentation of a portfolio of analysis techniques essential for any serious business process analysis work - and goes much further. Since those early days, there has been a rapid expansion of approaches to business process work, and most of these are reflected in the book's subtitle: architecture, engineering, improvement, management, and maturity. All these (and others) are addressed in the book, discussing the strengths and limitations of each. Whichever way you approach business process work, this book is essential reading for all practitioners because of its breadth and depth of commentary. It is careful to document sources, and has a comprehensive list of relevant material. The book is also essential reading for all students of business processes at final year undergraduate, and master's levels, as it meets relevant level descriptors. The book contains several innovative ideas, including: information technology is not the only enabling

technology for business process improvement: business processes have been improved since time immemorial by the utilization of technology, not only information technology - and this will continue given modern technology convergence; the origin of virtually all approaches to systems analysis (including object-oriented analysis, and relational theory), is identified and documented; diagrammatic approaches to analyzing business processes are incapable of yielding models that can be checked for completeness and consistency, particularly as the number of processes increases; increasingly, the issue is not only business processes within an organization - the issue is business processes that cross organizational boundaries and may involve many enterprises; the book calls for a business process epistemology to complement business process ontology. Whatever your view about approaches to business processes, you will find this book stimulating, challenging, comprehensive, and thought provoking.

This textbook explores the fundamental principles of Business Process Reengineering (BPR). The express aim of the book is to address the needs of MBA students opting for courses in 'Information Technology Management or 'Operations Management', MCA students who opt for Business Processes as an elective, and students of BE/B.Tech Mechanical Engineering and Production Engineering for courses in Process Engineering/Automation/Management System Design. The book provides them with the concepts, methodologies, models and tools needed to understand and implement BPR. In a nutshell, the book offers a step-by-step presentation of the practical framework and management techniques needed to achieve engineering solutions for implementation of BPR in an organization. The initial chapters introduce the reader to the need for BPR and its utility in relation to IT and manufacturing. The middle chapters cover the methodology, success factors, barriers, and the technologies that are relevant for BPR implementation. The latter chapters present solutions like lean and virtual manufacturing, enterprise resource planning, and functional information systems. An exclusive chapter is devoted to concepts and tasks of software reengineering. Aided by extensive illustrations, end-of-chapter review questions, as well as a chapter consisting entirely of case studies, this book will help students develop a rich, multifaceted perspective, to enable them to handle complex management and

engineering problems. The book will be useful to students in practically all branches of engineering, not just mechanical/production/industrial engineering.

Business Processes for Business Communities Springer Science & Business Media

A very large proportion of commercial and industrial concerns in the UK find their business competitiveness dependent on huge quantities of already installed, legacy IT. Often the nature of their business is such that, to remain competitive, they have to be able to change their business processes. Sometimes the required change is radical and revolutionary, but more often the required change is incremental. For such incremental change, a major systems engineering problem arises. The cost and delay involved in changing the installed IT to meet the changed business requirements is much too high. In order to address this issue the UK Engineering and Physical Science Research Council (EPSRC) set up, in 1996, a managed research programme entitled Systems Engineering for Business Process Change (SEBPC). I was appointed as co-ordinator of the programme. The overall aim of this new managed research programme was to release the full potential of IT as an enabler of business process change, and to overcome the disabling effects which the build-up of legacy systems has on such change. As such, this aim addressed a stated objective of the Information Technology and Computer Science (IT&CS) part of EPSRC to encourage research at a system level.

Due to growing concern about the competitiveness of industry in the international marketplace and the efficiency of government enterprises, widespread initiatives are currently underway to enhance the competitive posture of firms and to streamline government operations. Nearly all enterprises are engaged in assessing ways in which their productivity, product quality and operations can be improved. These efforts can be described as Business Process Engineering (BPE). BPE had its roots in industry under differing titles: Process Improvement, Process Simplification, Process Innovation, Reengineering, etc. It has matured to be an important ingredient of successful enterprises in the private and public sectors. After extensive exploitation by industrial and governmental practitioners and consultants, it is attracting increasing attention from academics in the fields of

engineering and business. However, even with all of this attention in the popular literature, serious scholarly literature on BPE is in short supply. It is somewhat surprising, especially since so many large international organizations have attempted BPE projects with varied success.

This volume shows how ICT (information and communications technology) can play the role of a driver of business process reengineering (BPR). ICT can aid in enabling improvement in BPR activity cycles as it provides many components that enhance performance that can lead to competitive advantages. IT can interface with BPR to improve business processes in terms of communication, inventory management, data management, management information systems, customer relationship management, computer-aided design, computer-aided manufacturing (CAM), and computer-aided engineering. This volume explores these issues in depth.
