Geometric Properties of the Shifted Hypergeometric Functions In mathematics, the Gaussian or ordinary hypergeometric function  ${}_2F_1(a,b;c;z)$  is a special function represented by the hypergeometric series, that includes many other special functions as specific or limiting cases. It is a solution of a second-order linear ordinary differential equation (ODE). Hypergeometric function - Wikipedia The hypergeometric function of one variable has played an important role in the development of many branches of mathematics such as special functions of real or complex variables, uniformization of Riemann surfaces, differential or difference equations, orthogonal polynomials, number theory etc. Springer
