Fear can't help you in a dangerous situation. A former FBI profiler shows you what can. As one of the world's top experts on psychopathy and criminal behavior, Mary Ellen O'Toole has seen repeatedly how relying on the sense of fear alone often fails to protect us from danger. Whether you are opening the door to a stranger or meeting a date you connected with online, you need to know how to protect yourself from harm-physical, financial, legal, and professional. Using the SMART method, which O'Toole developed and used at the FBI, we can confidently know how to: Respond to a threat in any situation Hire someone who will work inside your home like a contractor or housekeeper Figure out whether a prospective employee is a safe bet Know whom you can trust with your children An especially useful book for women living alone, parents who are concerned about their children's safety, and employers worried about employees who might go postal, *Dangerous Instincts* gives us the tools used by professionals to navigate potentially hazardous waters. Like *The Gift of Fear* and *The Sociopath Next Door*, it will appeal to anyone looking to make the right call in an ever-threatening world.

The Dogon believed that the alien Nummo would one day return to Earth. It was the duty of the Hogan, their spiritual leader, to safe guard the Earth until that time. The day of the Nummos' return was known to the Dogon as the "Day of the Fish." Day of the Fish reveals that the amphibious Nummo, who came to Earth from the stars, were the goddesses known to the peoples of the Neolithic and Paleolithic ages. Many of the Dogon symbols identified with the Nummo were the same symbols that Marija Gimbutas associated with the goddesses of Old Europe. Dorey also compares the Dogon religion with what is known of the Jomon people of Japan, who were Mesolithic-Neolithic hunters and gatherers from around 14,000 to 300 BCE. Dorey's research reveals that this is the oldest religion known to humanity and that understanding it is critical to our survival. She believes that knowing the truth about our past, will provide us with an understanding of the present and give us renewed hope for the future.

This text is ideal for junior-, senior-, and graduate-level courses in computer graphics and computer-aided design taught in departments of mechanical and aeronautical engineering and

computer science. It presents in a unified manner an introduction to the mathematical theory underlying computer graphic applications. It covers topics of keen interest to students in engineering and computer science: transformations, projections, 2-D and 3-D curve definition schemes, and surface definitions. It also includes techniques, such as B-splines, which are incorporated as part of the software in advanced engineering workstations. A basic knowledge of vector and matrix algebra and calculus is required.

This edition is in part a new work, and partly a revised and expanded version of the Pitt Press edition by J.M. MacGregor (Cambridge University Press, 1915). The Introduction is based on MacGregor's, revised and with an additional sections on Olynthos and the Chalcidian League, and Demosthenes' oratory. There is a also a new bibliography. The Greek text follows, along with a completely new commentary by E.I. McQueen, concentrating mainly on questions of grammar and syntax. The two Appendixes, on the Order of the Olynthiac Speeches and the Theoric Fund, have been completely rewritten to take account of modern scholarship.

This book addresses the impacts of current and future reproductive technologies on our world food production and provides a significant contribution to the importance of research in the area of reproductive physiology that has never been compiled before. It would provide a unique opportunity to separate the impacts of how reproductive technologies have affected different species and their contributions to food production. Lastly, no publication has been compiled that demonstrates the relationship between developments in reproductive management tools and food production that may be used a reference for scientists in addressing future research areas. During the past 50 years assisted reproductive technologies have been developed and refined to increase the number and quality of offspring from genetically superior farm animal livestock species.

Artificial insemination (AI), estrous synchronization and fixed-time AI, semen and embryo cryopreservation, multiple ovulation and embryo transfer (MOET), in vitro fertilization, sex determination of sperm or embryos, and nuclear transfer are technologies that are used to enhance the production efficiency of livestock species.

Dorey's research shows the African Dogon religion to be the oldest mythology in the world. It existed in Africa long before humans migrated to other areas. Dorey has found fragments of the Dogon religion all over the world. The Nummo, the title of the book, refers to alien beings who were considered immortal by the Dogon people. According to the Dogon, these fish and serpent like beings came to Earth from the stars. When they died and were reborn they could remember their previous existence. The Dogon elder Ogotemméli described life and death for the amphibious Nummo as being like a snake shedding its skin. According to the Dogon, in the beginning of human existence immortality was the norm and time, as we know it, was irrelevant. This book is vital in the search for the truth about human origins.

Debugging Linux Systems discusses the main tools available today to debug 2.6 Linux Kernels. We start by exploring the seemingly esoteric operations of the Kernel Debugger (KDB), Kernel GNU DeBugger (KGDB), the plain GNU DeBugger (GDB), and JTAG debuggers. We then investigate Kernel Probes, a feature that lets you intrude into a kernel function and extract debug information or apply a medicated patch. Analyzing a crash dump can yield clues for postmortem analysis of kernel crashes or hangs, so we take a look at Kdump, a serviceability tool that collects a system dump after spawning a new kernel. Profiling points you to code regions that burn more CPU cycles, so we learn to use the OProfile kernel profiler and the gprof application profiler to sense the presence of code bottlenecks. Because tracing provides insight into behavioral problems that manifest during interactions between different code modules, we delve into the Linux Trace Toolkit, a system designed for high-volume trace capture. The section "Debugging Embedded Linux" takes a tour of the I/O interfaces commonly found on embedded hardware, such as flash memory, serial port, PCMCIA, Secure Digital media, USB, RTC, audio, video, touch screen, and Bluetooth, and provides pointers to debug the associated device drivers. We also pick up some board-level debugging skills with the help of a case study. The section "Debugging Network Throughput" takes you through some device driver design issues and protocol implementation characteristics that can affect the horsepower of your network interface card. We end the shortcut by examining several options available in the kernel configuration menu that can emit valuable debug information.
