"The King Who Was a King - The Book of a Film" is a fascinating treatise on the development of film written by H. G. Wells and first published in 1929. Writing at the when cinema was beginning to explode, Wells explores the emerging industry's history, future, and the elements of contemporary film.

"Sydney the Kidney" embraces themes found in many classical children's tales, giving them a new and thoughtful treatment. It tells the story of a group of friends (beans) struggling to find a place for themselves in the world. In the end, they realize that the best way to find a place is to work together and create one. I spent more than 10 years mulling over the ideas compiled in this work. My hope is that the whimsical nature of the writing will resonate with readers on all levels and appeal to audiences of all ages.

Kidney transplantation is a complex field that incorporates several different specialties to manage the transplant patient. This book was created because of the importance of kidney transplantation. This volume focuses on the complexities of the

transplant patient. In particular, there is a focus on the comorbidities and special considerations for a transplant patient and how they affect kidney transplant outcomes. Contributors to this book are from all over the world and are experts in their individual fields. They were all individually approached to add a chapter to this book and with their efforts this book was formed. Understanding the Complexities of Kidney Transplantation gives the reader an excellent foundation to build upon to truly understand kidney transplantation.

This volume will be a reliable source on the management of the elderly with renal disease. There is an ever-increasing proportion of the aging population affected by renal disease and hypertension, and physicians are faced with atypical clinical presentations of renal disease in the aged as compared to younger people. This volume combines the fields of nephrology and geriatrics and presents a multidisciplinary approach to the topic.

Living donor kidney (LDK) transplantation has become the definitive approach to the treatment of end-stage renal failure, providing a better quality of life and the best opportunity for

survival when compared with dialysis or transplantation from a deceased donor. A timely compendium of the modern day practice of LDK transplantation from a group of outstanding international experts, this text explores a number of controversial aspects of this innovative new technique. Discussing in detail the current situation, the authors also focus on the responsibility of the medical community to the live kidney donor as a patient, and the potential for complacency regarding donor risk. Emphasizing the ethical principles that must dictate medical practice in LDK transplantation for the foreseeable future - voluntarism, informed consent and medical follow-up - this book comprehensively records the best practices currently available.

 Man and the Liver describes the development of man's thinking about the role of the liver, from early times to the present. It considers both culinary and religious uses of the liver and describes the author's contacts with distinguished scientists who have shaped his thinking. The book discusses many aspects of normal liver structure and function and how these are affected when diseased. It is written to provide scientific information - not as a textbook, but many sections could be used by those studying this field. The topics covered, including some mathematics, can be followed by anyone who has studied science at senior school level. It will appeal to readers interested in human biology, and covers science, medicine, history, hepatology and gastroenterology. Man and the Liver is an interesting and unusual hybrid of these subjects and the personalities involved. Author Robert is currently Emeritus Professor of Medicine at the University of London.

This second edition offers a comprehensive overview of the physiological functions of vertebrate kidneys from a comparative viewpoint, with particular emphasis on nonmammalian vertebrates. The topics covered include renal structure; glomerular ultrafiltration; tubular transport of inorganic ions, organic substances, and fluid; and urine dilution and concentration. Mammalian renal function is only considered for purposes of comparison with nonmammalian renal function and as a frame of reference for some of the discussions. The major findings on nonmammalian renal function and the important unanswered questions raised by those findings are described in detail. As such, the book provides comprehensive information on comparative renal function for biological scientists and advanced students of biology with some knowledge of physiology and a desire to know more about renal function in vertebrates, and for mammalian renal physiologists who wish to obtain a broader view of renal function.
