This causes strain at the level of Tendon 1, resulting in a prestress loss in Tendon 1. The stress due to Tendon 2 is: $(\sigma_c - \sigma_p) = \frac{P}{A} + \frac{P e}{I} + \frac{P e^2}{I^2} + \frac{P e^3}{I^3}$ Note that the actual properties are approximated with the gross properties, $g A$ and $g I$. Prestressed Concrete Design - SlideShare Prestressed concrete is a form of concrete used in construction. It is substantially "prestressed" during its fabrication, in a manner that strengthens it against tensile forces which will exist when in service.: 3-5 This compression is produced by the tensioning of high-strength "tendons" located within or adjacent to the concrete and is done to improve the performance of the concrete in ...
