RODERICK ODONNELL

The Woman Lawyer Routledge

Classification and regression trees (CART) is one of the several contemporary statistical techniques with good promise for research in many academic fields. There are very few books on CART, especially on applied CART. This book, as a good practical primer with a focus on applications, introduces the relatively new statistical technique of CART as a powerful analytical tool. The easy-to-understand (non-technical) language and illustrative graphs (tables) as well as the use of the popular statistical software program (SPSS) appeal to readers without strong statistical background. This book helps

readers understand the foundation, the operation, and the interpretation of CART analysis, thus becoming knowledgeable consumers and skillful users of CART. The chapter on advanced CART procedures not yet well-discussed in the literature allows readers to effectively seek further empowerment of their research designs by extending the analytical power of CART to a whole new level. This highly practical book is specifically written for academic researchers, data analysts, and graduate students in many disciplines such as economics, social sciences, medical sciences, and sport sciences who do not have strong statistical background but still strive to take full advantage of CART as a powerful analytical tool for research in their fields.

Classification and Regression Trees

This eye-opening new book provides a fascinating study of the status and experiences of women in the law, and is unique in its analysis of developments from the law school to the judiciary. The Woman Lawyer also advocates the need for fundamental reforms in law schools and legal practice and canvasses many options. Combining detailed empirical evidence, including material specifically gathered for the book, with information and advice, The Woman Lawyer seeks to raise the level of public debate on these issues. In addition, the book aims to inform, encourage, inspire and empower women studying and working in the law. *Classification and Regression Trees* The methodology used to construct tree structured rules is the focus of this monograph. Unlike many other statistical procedures, which moved from pencil and

paper to calculators, this text's use of trees was unthinkable before computers. Both the practical and theoretical sides have been developed in the authors' study

of tree methods. Classification and Regression Trees reflects these two sides, covering the use of trees as a data analysis method, and in a more

mathematical framework, proving some of their fundamental properties.
