A compact, "how-to" manual on effective, evidence-based treatments for enuresis and encopresis. The aim of this book is to provide readers with a practical overview of the definitions, characteristics, theories and models, diagnostic and treatment recommendations, and relevant aspects and methods of evidence-based psychosocial treatments for encopresis and enuresis, primarily in children. Although treatments and research for elimination disorders are reviewed in general, particular attention is directed at constipation and encopresis, toileting refusal, and diurnal and nocturnal enuresis due to the high incidence of these conditions in children. Case vignettes, websites, and suggestions for further reading are provided for the interested reader.

Three distinct types of contractions perform colonic motility functions. Rhythmic phasic contractions (RPCs) cause slow net distal propulsion with extensive mixing/turning over. Infrequently occurring giant migrating contractions (GMCs) produce mass movements. Tonic contractions aid RPCs in their motor function. The spatiotemporal patterns of these contractions differ markedly. The amplitude and distance of propagation of a GMC are several-fold larger than those of an RPC. The enteric neurons and smooth muscle cells are the core regulators of all three types of contractions. The regulation of contractions by these mechanisms is modifiable by extrinsic factors: CNS, autonomic neurons, hormones, inflammatory mediators, and stress mediators. Only the GMCs produce descending inhibition, which accommodates the large bolus being propelled without increasing muscle tone. The strong compression of the colon wall generates afferent signals that are below nociceptive threshold in healthy subjects. However, these signals become nociceptive; if the amplitudes of GMCs increase, afferent nerves become hypersensitive, or descending inhibition is impaired. The GMCs also provide the force for rapid propulsion of feces and descending inhibition to relax the internal anal sphincter during defecation. The dysregulation of GMCs is a major factor in colonic motility disorders: irritable bowel syndrome (IBS), inflammatory bowel disease (IBD), and diverticular disease (DD). Frequent mass movements by GMCs cause diarrhea in diarrhea predominant IBS, IBD, and DD, while a decrease in the frequency of GMCs causes constipation. The GMCs generate the afferent signals for intermittent short-lived episodes of abdominal cramping in these disorders. Epigenetic dysregulation due to adverse events in early life is one of the major factors in generating the symptoms of IBS in adulthood.

Current Surgical Therapy E-Book Hogrefe Publishing

The book describes the current management of fecal incontinence from an advanced practice nursing perspective. It fills a gap in nursing knowledge promoting and showcasing the expertise and significant contribution of advanced practice nurses whose role is so important in the health care system. Authors' objectives are to disseminate information about evidenced-based nursing care for the incontinent patient to improve outcomes and quality of life as well as to instruct nurses involved in continence care to practice at a high quality level. The book is structured in chapters, starting by explaining fecal incontinence and its impact on quality of life. The second chapter discusses advanced practice continence nursing. The epidemiology of fecal incontinence is reviewed to provide an appreciation of the scope of the problem. Normal defecation and mechanisms to ensure continence are reviewed to improve understanding of the alterations resulting in fecal incontinence. The next chapters focus on assessment, diagnosis and management of fecal incontinence in various patient groups which parallels the delivery of care. Since surgery is a treatment option in some cases, a chapter explains surgical approaches and the postoperative nursing care. As skin damage is the most common complication of fecal incontinence there is a chapter about management of these associated problems. The last chapter addresses managing fecal incontinence in the patient with

urinary continence also. Practice related chapters include a case study. All chapters highlight key information in a box or table. The intended readers are international advanced practice nurses who care for patients with incontinence as well as continence nurse specialists practicing at a general level. General nurses interested in continence care might also be interested in reading the book. Other disciplines who are part of the healthcare team may be interested in learning more about role of the advanced practice nurse.

Constipation in childhood is often dismissed as a mild and trivial problem. However, for those children who suffer with bowel dysfunction, the pain, shame, and despair associated with incontinence and painful defecation may have ramifications for a lifetime. Surprisingly, many health care providers are not well-informed about how to deal with childhood constipation. Little information is readily available to doctors and nurses confronted with this often perplexing problem. This book presents the scientific background, physiology, and clinical features of children who present with problems of defecation. It also contains a booklet designed to be copied and distributed to parents and children to help them understand this distressing condition. The book is designed to be an easily accessible source of information for practitioners and students of pediatrics, child psychiatry, and gastroenterology, as well as family physicians.

Colorectal surgery is a very ancient art that has, over the last few decades, found a sound basis in science. Amongst its famous ancient practitioners was Hippocrates himself. Colorectal-surgical departments have been springing up worldwide and many of the surgical colleges and academies are beginning to see the importance of this branch of medicine. After rising from humble beginnings, the specialty of colorectal surgery is now a much-sought-after career amongst young doctors all over the world. Topics in Colorectal Surgery is an invaluable book from one of the leading colorectal centres in the world. It represents some of the most important lectures given over the last eight years at the Annual Singapore General Hospital Colorectal Week. This event has become an internationally acclaimed gathering and the book contains updated lecture notes from the last seven conferences. These lecture notes, together with the book chapters, contain material not often found in other books and will be a valuable source of reference for clinicians dealing with the problems discussed in the text.

Chronic constipation is associated with pain, stress, and fecal incontinence, which negatively impact health-related quality of life (HRQoL); however, it is unclear if patterns of pain, stool frequency, and incontinence are differentially associated with HRQoL in youth with chronic constipation. Four hundred and ten caregivers completed a demographics and symptoms form, the Parental Opinions of Pediatric Constipation, Pediatric Symptom Checklist, and the Functional Disability Inventory. Stooling patterns were derived using Latent Variable Mixture Modeling. A three-class model emerged: withholding/avoiding (WA), pain, and fecal incontinence (FI). The pain class reported the greatest amount of disease burden/distress, greatest impairments in illness related activity limitations, more psychosocial problems, and, along with the FI class, elevated levels of family conflict. The FI class reported the greatest amount of parental worry of social impact. Youth with chronic constipation who experience pain or fecal incontinence may be at a greater risk for specific

HRQoL problems such as illness related activity limitations, psychosocial issues, disease burden and worry, and family conflict.
