assessments, of students who had failed and were repeating an Algebra 1 course. Prior to the start of this study, students from both the control and treatment groups completed an attitudinal survey to gauge their perceptions of school, the math classroom and their own mathematical ability. Two Algebra 1 units were then taught within the eight-week span of the study. During the first unit, students in the control group received direct instruction about how to solve a system of linear equations before completing a series of practice problems using their instructors work as a model. Students in the treatment group began each lesson of the first unit by completing a problem-based learning task before receiving the same direct instruction and practice problems as the control group. At the start of the second unit, the roles of the classes were switched. The previous control group completed problem-based learning tasks at the start of every lesson, while the previous treatment group no longer completed the tasks. Classroom observations were made throughout both units in order to record whether or

not each student's efforts were productive. At the end of each unit of study, students from both groups took the same summative assessment. After taking the second unit assessment, students completed the attitudinal survey once again. Analysis of each student's performance on the unit assessments, the classroom observations, and the attitudinal survey data, determined if a significant gain in conceptual understanding had occurred in either class and if the learning environment created in each class was sufficient for such a gain to occur. The results of this study indicate that the frequent implementation of brief problem-based learning tasks did not improve the conceptual understanding of repeat Algebra 1 students.

Word Problems. Does even thinking about solving word problems in math make you feel tense, anxious, confused, or frustrated? You're not alone. Most high school students - even ones who excel in their math classes - find word problems on the PSAT/NMSQT, SAT, and ACT tough to solve consistently and efficiently. Adult students preparing for the GMAT or GRE find word problems just as daunting as these were in high school. Most major publishers only briefly explain word problems and demonstrate simple examples in their study guides, but challenge students with very difficult practice problems. Even students in their test prep courses remain confused and lacking in confidence about how to approach word problems. All Your Word Problems Solved serves as an invaluable supplement to whichever test-specific study guide you prefer. This book will help you learn to systematically decode math word problems, set up the correct equations, organize your scratch

work to "error-proof" yourself, and efficiently arrive at the right answer, every time. The strategies, approaches, techniques, and tips found in this book have been created and tested with students aged 15 to 40+ preparing for the most common standardized college and graduate admissions tests, including the GMAT, GRE, SAT, PSAT/NMSQT and ACT. In this book, you will learn a set of structured-but-flexible approaches which can be combined in different ways to solve even the hardest questions on your standardized tests. What makes this book so valuable? In the words of a GMAT student: "Clear explanation of how to organize your work and make sense of what you are actually solving for." Presentation of information is designed to accelerate your learning and improve your retention of facts, relationships, and formulas. Sample problems which demonstrate key methods progress in difficulty, so there is no huge jump between the examples and problems in the Official Guide. Refresher content and variety of examples for word

problems related to concepts in Algebra 1, Algebra 2 and Geometry. You'll find out how to recognize, approach, and solve word problems of many types: linear equations, exponential growth, ratios, proportions, age problems, work-rate, distance-rate, systems of equations, mixtures, dilutions, interest, profit, percent change, complex geometric figures, probability, permutations & combinations, weighted averages, sequences, patterns, functions and symbol problems.
