 Laboratory work is a prominent feature of education in Science and Technology based subjects. However, it should not be forgotten that practise without theory is blind and Theory without practise is lame. A person interested in acquiring engineering skills must have a balanced knowledge of theory as well as practise. Thus, engineering practice, a study and practice of the scientific principles underlying the art of manufacture.

This Civil Engineering Book is one-of-a-kind. This book is structured to raise the level of expertise in Civil Engineering and to improve the competitiveness in the global markets. A civil engineer is someone who applies scientific knowledge to improve infrastructure and common utilities that meet basic human needs. Civil engineers plan, design and manage large construction projects. This could include bridges, buildings, dams, tunnels, buildings, airports, water and sewage systems, transport links and other major structures. They use computer modelling software and data from surveys, tests and maps to create project blueprints. These plans advise contractors on the best course of action and help minimise environmental impact and risk.

Buildings and bridges are often the first structures to come to mind, because they are the most obvious engineering creations. But civil engineers are also responsible for less visible creations and contributions. Every time we open a water faucet, we expect water to come out, without thinking that civil engineers made it possible, in many cases by designing systems that transport water to cities from mountain sources that are sometimes hundreds of miles away. Civil engineering is one of the oldest and broadest engineering professions. It focuses on the infrastructure necessary to support a civilized society. The Roman aqueducts, the great European cathedrals, and the earliest metal bridges were built by highly skilled forerunners of the modern civil engineer. These craftsmen of old relied on their intuition, trade skills, and experience-based design rules, or heuristics, derived from years of trial and error experiments but rarely passed on to the next generation. This book of Civil Engineering covers Below Subjects  FUNDAMENTALS  BUILDING CONSTRUCTION  CONCRETE TECHNOLOGY  CONSTRUCTION ENGINEERING  ENVIRONMENTAL SCIENCE AND ENGINEERING  GEOTECHNICAL ENGINEERING  GEOTHERMAL ENGINEERING  HYDRAULICS  PAVEMENT  STRUCTURAL ENGINEERING  TRANSPORTATION ENGINEERING  MUNICIPAL SOLID WASTE MANAGEMENT  WATER RESOURCES ENGINEERING In contrast, today's civil engineers bring to bear on these problems a knowledge of the physical and natural sciences, mathematics, computational methods, economics, and project management. Civil engineers design and construct buildings, transportation systems (such as roads, tunnels, bridges, railroads, and airports), and facilities to manage and maintain the quality of water resources. Society relies on civil engineers to maintain and advance human health, safety, and our standard of living. Those projects that are vital to a community's survival are often publicly funded to ensure that they get done, even where there is no clear or immediate profit motive.

Rogers: Highway Engineering This book provides an introduction to highway engineering for students on degree and diploma courses in civil engineering. It moves in a logical sequence from the planning and economic justification for a highway, through the geometric design and traffic analysis of highway links and intersections, to the design and maintenance of both flexible and rigid pavements. Existing texts have tended to concentrate purely on highway planning and analysis, or on pavement design and maintenance aspects of highway engineering. As a result, the standard has tended to be too advanced for students studying the subject for the first time. This textbook covers the basic ground in both areas. It features worked examples and case studies as an aid to understanding individual topics and aims to provide the student with a solid, practically based foundation for the topic of highway engineering, thus providing a gateway to the more advanced and specialised texts. The author Martin Rogers, BE, MEngSc, PhD, BA(Public Ad), CEng, MICE, MRTPI, Chartered Engineer and Chartered Town Planner, received his professional education at University College Dublin and the Institute of Public

Administration, Dublin. He has worked in private practice and as a senior local authority engineer and was a member of the Dublin Transport Initiative Study Team that devised the current transportation plan for the Dublin city region. He joined the permanent staff at the Dublin Institute of Technology in 1993 and is currently a Senior Lecturer in the Department of Civil and Structural Engineering. He has previously co-written one postgraduate and one undergraduate text on project appraisal methods and has published technical papers in a number of internationally recognised engineering, construction, planning and operational research journals.
