 Augmented Reality With Kinect Wang  
 Augmented reality (AR) is an interactive experience of a real-world environment where the objects that reside in the real world are enhanced by computer-generated perceptual information, sometimes across multiple sensory modalities, including visual, auditory, haptic, somatosensory and olfactory. AR can be defined as a system that fulfills three basic features: a combination of real and ...  
 Augmented reality - Wikipedia  
 A virtual reality headset is a head-mounted device that provides virtual reality for the wearer. Virtual reality (VR) headsets are widely used with video games but they are also used in other applications, including simulators and trainers. They comprise a stereoscopic head-mounted display (providing separate images for each eye), stereo sound, and head motion tracking sensors (which may ...

 Neural Compositing for Real-time Augmented Reality Rendering in Low-frequency Lighting Environments. Shengjie Ma, Qian Shen, Qiming Hou, Zhong Ren, Kun Zhou. Science China (Information Science), 2021, One-shot Face Reenactment Using Appearance Adaptive Normalization  
 Kun Zhou I am very skeptical about Microsoft Mesh, the company's new virtual-reality platform, and you should be, too. Microsoft's last attempt at virtual reality, the HoloLens headset, was introduced with a flourish before largely melting away. The signs so far for Mesh suggest a similarly concerning pattern.

 Hand gesture recognition is very significant for human-computer interaction. In this work, we present a novel real-time method for hand gesture recognition. In our framework, the hand region is extracted from the background with the background subtraction method. Then, the palm and fingers are segmented so as to detect and recognize the fingers. Finally, a rule classifier is applied to predict ...
