Introduction. Quadrature signals are based on the notion of complex numbers and perhaps no other topic causes more heartache for newcomers to DSP than these numbers and their strange

Quadrature Signals: Complex, But Not Complicated A quadrature signal is a two-dimensional

straightforward process, and best described by an example. Think of a real-valued discrete

sequence $x(n)$ having an $|X(m)|$ spectral magnitude whose non-zero-valued samples are shown as

Signals Richard Lyons explains this carefully in his very interesting piece on "Quadrature Signals:

Complex but not complicated". Quadrature signals have a very interesting application in signal

processing. By using both the in-phase and quadrature components of a sampled signal it is possible

to actually double the acquired bandwidth from the Nyquist limit $f_s/2$ to f_s . The matlab example

code serves as an example for this. The local oscillator is set at 400 Hz GitHub -
