Comprised of fifteen chapters written by experienced consumer health librarians, The Medical Library Association Guide to Providing Consumer and Patient Health Information is designed for library and information science graduate students as well as librarians new to health and medical librarianship, regardless of library setting. It is comprehensive in scope, covering all aspects of consumer and patient health and medical information from their humble, grassroots beginnings to the ever-evolving applications of new technology and social media. In between, the mundane aspects of health and medical

librarianship, such as needs assessment, costs, budgeting and funding, and staffing are discussed. Adding richness to this discussion are the coverage of more sensitive topics such as patient-friendly technology, ethical issues in providing consumer and patient health information, meeting the needs of diverse populations, and responding to individuals from various cultural backgrounds. No comprehensive picture of consumer and patient health librarianship would be complete without addressing the critical importance of marketing and strategic partnerships; such discussions round out this invaluable guide.. Patients today must be knowledgeable enough to participate in their health and well-being. Shorter hospital stays, changing

reimbursement patterns and the gradual shift towards focusing on proactively maintaining health and managing disease require patients to be informed and actively engaged. Education, information and understanding are important components of actively-engaged patients. Correspondingly, in today's e-world, there is a glut of information resources available through the Internet – from YouTube videos to Googling to blogs and Twitter feeds. What is lacking in these information-rich times is the relevance of meaning and context for those who ask, “Does this health and medical information apply to me and my unique clinical picture?” or “How do I use this information?” As knowledge navigators, information technology wizards and content experts, librarians offer focused responses to individuals' specific and highly personal health and medical information queries. In a new healthcare world order of optimizing health and minimizing hospitalizations, such a service is invaluable. Sadly, there still exists in our highly networked and technological age an

information gap for those who struggle in obtaining meaningful health or medical information. These individuals may be foreign-born, non-English speaking, poor, rural, aged or semi-literate. Whatever their status, librarians must have the wherewith-all to find germane resources and also help create responsive mechanisms to bridge that health information gap for vulnerable citizens. The Medical Library Association Guide to Providing Consumer and Patient Health Information will guide you on the road to providing that response.

This 5th edition of this essential textbook continues to meet the growing demand of practitioners, researchers, educators, and students for a comprehensive introduction to key topics in biomedical informatics and the underlying scientific issues that sit at the intersection of biomedical science, patient care, public health and information technology (IT). Emphasizing the conceptual basis of the field rather than technical details, it provides the tools for study required for readers to comprehend, assess, and utilize biomedical informatics and health IT. It focuses on practical

examples, a guide to additional literature, chapter summaries and a comprehensive glossary with concise definitions of recurring terms for self-study or classroom use.

Biomedical Informatics: Computer Applications in Health Care and Biomedicine reflects the remarkable changes in both computing and health care that continue to occur and the exploding interest in the role that IT must play in care coordination and the melding of genomics with innovations in clinical practice and treatment. New and heavily revised chapters have been introduced on human-computer interaction, mHealth, personal health informatics and precision medicine, while the structure of the other chapters has undergone extensive revisions to reflect the developments in the area. The organization and philosophy remain unchanged, focusing on the science of information and knowledge management, and the role of computers and communications in modern biomedical research, health and health care.

Regarding longevity and increase of chronic diseases traditional medical care faces tremendous financial and human resource problems. Is self-service medicine as follow up of traditional care or as an approach in its own right the answer? Are internet and app stores the place where self service medicine takes place? The book distinguishes stages of such an endeavour.
