This edition of Health and safety in welding and allied processes has been extensively revised to take into recent account advances in technology and legislative changes both in the UK and USA. Beginning with a description of the core safety requirements, it goes on to describe the special hazards found in the welding environment - noise, radiation, fume, gases and so on in terms of their effects and the strategies that can be adopted to avoid them. The book takes each major joining technology in turn and discusses the key hazards that are most relevant to each process. There are chapters covering: the common arc and gas welding processes; specialised welding processes; brazing, soldering and thermal spraying; welding and flame spraying of plastics; radiographic inspection; mechanical hazards; noise and vibration; radiation; compressed gases; fume and ventilation; fire and first aid; and welding in situations of increased hazard, such as those requiring special precautions to ensure safe working on vessels contaminated by flammable materials. The aim throughout the book is to explain the hazards clearly and concisely, describe how they arise, and suggest practical methods to achieve safe working. Health and safety in welding and allied processes is an essential resource for welders, their managers and all health and safety practitioners who have welding and related processes taking place in their workplaces. A completely revised new edition of the definitive work on welding health and safety Provides detailed risk analysis for all the major processes Shows how to set up effective workplace systems for risk assessment, first aid and reporting

The hardest data for managers and engineers in charge of the design and implementation of robot systems to acquire is also the most valuable: case studies detailing best current practice and the return on investment actually achieved. It has been a major goal of the British Robot Association, among other professional groups, to organise meetings where such case studies are presented and discussed between members; but the obvious restrictions of commercial confidentiality lead to considerable difficulty, especially in relation to the best recent installations. The authors of this book have been in the uniquely privileged position of lecturing in the Cambridge University Production Engineering Tripos, a course specially organised in conjunction with a number of leading companies applying robots and automation. Actual case studies from these companies form an important part of the course, making this book that has emerged from it a uniquely important addition to our Open University Press series.
