[Building Design Using Cold Formed Steel Sections](#) Ernst & Sohn

Cold formed structural members are being used more widely in routine structural design as the world steel industry moves from the production of hot-

rolled section and plate to coil and strip, often with galvanised and/or painted coatings. Steel in this form is more easily delivered from the steel mill to the manufacturing plant where it is usually cold-rolled into open and closed section members. This book not only summarises the research performed to date on cold form tubular members and connections but also compares design rules in various standards and provides practical design examples.

"After some 25 years in preparation the key parts of EN 1993-1-1 Eurocode 3: Design of steel structures General rules and rules for buildings have now been finalised. Eurocode 3 covers many forms of steel construction and provides the most comprehensive and up-to-date set of design guidance currently available." "Throughout, this book concentrates on the most commonly encountered aspects of structural steel design, with an emphasis on the situation in buildings. Much of its content is therefore devoted to the provisions of the Part 1.1: General rules and rules for buildings of EN 1993. This is, however, supplemented by material on loading, joints and cold-formed design. For each of the principal aspects covered, the book provides background to the structural behaviour, explanation of the codified treatment including departure from existing practice (BS 5950), and numerous worked examples. This Guide should serve as the primary point of reference for designing steel structures to Eurocode 3."--BOOK JACKET.
