Memory Keepers – Support for People Impacted by Memory Loss

Many stroke survivors experience personality changes like one-side neglect and impulsiveness. Neglect can run the gamut from someone who doesn't recognize paralyzed limbs as their own to those who ignore food on one side of the plate or words on one side of the page.

Cognitive behavioural therapy (CBT) may be offered if the person develops depression or anxiety. Cognitive stimulation therapy is a popular way to help keep someone's mind active. It involves doing themed activity sessions over several weeks. Cognitive rehabilitation can enable an individual to retain skills and cope better.
