Ready Protecting groups are a sad fact of synthetic chemistry They are usually needed, but rarely desired Many syntheses have stalled because of trouble putting on or removing protecting groups 4 basic questions to address when choosing a P.G.: 1.Protecting Groups in Organic Synthesis-1 ReadyA protective group (also referred to as "protecting group") is a reversably formed derivative of an

existing functional group in a molecule. The protective group is temporarily attached to decrease reactivity so that the protected functional group does not react under synthetic conditions to which the molecule is subjected in one or more subsequent steps.Protective Groups - Organic ChemistryA protective group or protective group is introduced into a molecule by chemical modification of a functional group to obtain chemoselectivity in a

subsequent chemical reaction. It plays an important role in multistep organic synthesis. In many preparations of delicate organic compounds, some specific parts of their molecules cannot survive the required reagents or chemical environments. Then, these parts, or groups, must be protected. For example, lithium aluminium hydride is a highly reactiveProtecting group - WikipediaThe silyl ether protecting group is cleaved off with fluoride
