 Allura's life is a testament to the strength and resilience of cross-cultural educated Middle Eastern women in the modern age, who are railing against a life that makes little sense, with all its twists and turns. Her compelling emotional journey is based on true stories of extraordinary women who are wrongly conceived by the outside world as "spoilt." A tower of strength and energy, her enthusiasm to challenge life's obstacles and temptations reflects some of the mind-blowing hardships some women experience. Bound by passion, linked by need - she is compelled to stand on her two feet early in life. Having a first-hand experience of the real world, Allura's reclusive and

vulnerable character turned into bold, courageous, resolute, fiery and tempestuous. Social constraints, family upheavals and unexpected tragedies are just among a few things that force Allura to make life changing choices of her own, which is when her whole world begins to unravel. Inspired by a true story.

The use of computation and simulation has become an essential part of the scientific process. Being able to transform a theory into an algorithm requires significant theoretical insight, detailed physical and mathematical understanding, and a working level of competency in programming. This upper-division text provides an unusually broad survey of the topics of modern computational

physics from a multidisciplinary, computational science point of view. Its philosophy is rooted in learning by doing (assisted by many model programs), with new scientific materials as well as with the Python programming language. Python has become very popular, particularly for physics education and large scientific projects. It is probably the easiest programming language to learn for beginners, yet is also used for mainstream scientific computing, and has packages for excellent graphics and even symbolic manipulations. The text is designed for an upper-level undergraduate or beginning graduate course and provides the reader with the essential knowledge to understand computational tools and mathematical methods well enough to be successful. As part of the teaching of using computers to solve scientific problems, the reader is encouraged to work through a sample problem stated at the beginning of each chapter or unit, which involves studying the text, writing, debugging and running programs, visualizing the results, and the expressing in words what has been done and what can be concluded. Then there are exercises and problems at the end of each chapter for the reader to work on their own (with model programs given for that purpose). The text could be used for a one-semester course on scientific computing. The relevant topics for that are covered in the first third of the book. The latter two-thirds of the text includes more physics and can be used for a two-semester course in computational physics, covering nonlinear ODEs, Chaotic Scattering, Fourier Analysis, Wavelet Analysis, Nonlinear Maps, Chaotic systems, Fractals and Parallel Computing. The e-book extends the paper version by including many codes, visualizations and applets, as well as links to video lectures. \* A table at the beginning of each chapter indicates video lectures, slides, applets and animations. \* Applets illustrate the results to be expected for projects in the book, and to help understand some abstract concepts (e.g. Chaotic Scattering) \* The eBook's figures, equations, sections, chapters, index, table of contents, code listings, glossary, animations and executable codes (both Applets and Python programs) are linked, much like in a Web document. \* Some equations are linked to their xml forms (which can be imported into Maple or Mathematica for manipulation). \* The e-book will link to video-based lecture modules, held by principal author Professor Rubin Landau, that cover most every topic in the book.

"We're going to raise traders just like they raise turtles in Singapore." So trading guru Richard Dennis reportedly said to his long-time friend William Eckhardt nearly 25 years ago. What started as a bet about whether great traders were born or made became a legendary trading experiment that, until now, has never been told in its entirety. Way of the Turtle reveals, for the first time, the reasons for the success of the secretive trading system used by the group known as the "Turtles." Top-earning Turtle Curtis Faith lays bare the entire experiment, explaining how it was possible for Dennis and Eckhardt to recruit 23 ordinary people from all walks of life and train them to be extraordinary traders in just two weeks. Only nineteen years old at the time-the youngest Turtle by far-Faith traded the largest account, making more than \$30 million in just over four years. He takes you behind the scenes of the Turtle selection process and behind closed doors where the Turtles learned the lucrative trading strategies that enabled them to earn an average return of over 80 percent per year and profits of more than \$100 million. You'll discover How the Turtles made money-the principles that guided their trading and the step-by-step methods they followed Why, even though they used the same approach, some Turtles were more successful than others How to look beyond the rules as the Turtles implemented them to find core strategies that work for any tradable market How to apply the Turtle Way to your own trades-and in your own life Ways to diversify your trading and limit your exposure to risk Offering his unique perspective on the

experience, Faith explains why the Turtle Way works in modern markets, and shares hard-earned wisdom on taking risks, choosing your own path, and learning from your mistakes.
