The Elements of Fractional Distillation | Nature
 Fractional distillation is a process by which components in a chemical mixture are separated into different parts (called fractions) according to their different boiling points. Fractional distillation is used to purify chemicals and to separate mixtures to obtain their components. Fractional Distillation Definition and Examples

 Fractional distillation is used to purify chemicals and also to separate mixtures to obtain their components. It is used for the purification of water as well as separating acetone and water. It is used in several industries like oil refineries and chemical plants mainly for purification and separation of many organic compounds. Describe Principle of Fractional Distillation - QS Study
 Fractional distillation Miscible liquids are ones that can mix together - like water and ethanol. Immiscible liquids are ones that can't - like oil and water. Fractional distillation - Chemical analysis - (CCEA ... Elements, Compounds and Mixtures. What is Fractional Distillation?. Fractional Distillation is a separation technique that is used for liquids that dissolve in each other. Liquids that dissolve in each other are called miscible. A liquid can be separated from a mixture of liquids in a solution by fractional distillation.. The solution is heated until it boils. The liquid with the lowest ...
