Do you think Chinese tanks and models are not interesting? Wait to see this book ... Until now is the most complete, detailed and exhaustive study about PLA for modelers ever done. This book is not

only having historians in mind but also for modelers and readers that can be interested to know something more about the Chinese army power. After reading this book many modelers will have much more interest in building a Chinese vehicle as next model. Through its pages we will discover not only the power and main weapons of the Chinese PLA since its origins, but also the way to paint them, showing different techniques and camouflages for the Chinese vehicles. The kits which appear in this book, belong to the main Chinese brands, and makes this book the perfect guide not only for modelers and enthusiasts of Chinese tanks and its strange and exotic camouflages but also for any modelers that want to have a reference book. Modelers and historians

like Adam Wilder, Kristof Pulinks, Lukasz Orczyyc-Musialek, Lester Plaskitt, Sven Frich, Zach Sex, Gordon Arthur, Lei Xu, Verlag Jochen, Chris Jerret, Oscar Ebrí, Brian Murdoch or David Bocquelet give us an idea of the quality of this publication that until now is the most complete, detailed and exhaustive study about PLA for modelers ever done.

Standard Practice for Low and Medium Speed Stationary Diesel Engines Voyage Press

DEUTZ AG, co-founded in 1864 by Nicolaus August Otto, the inventor of the four-stroke cycle engine, has developed the new 2013 engine for commercial vehicles on the basis of the tried and tested 1012 and 1013 series. Wit 4- and 6-cylinder models, the engine covers the power range between 100 and 190

kW. At the time of their introduction to the market, the engines will meet the exhaust emission legislation of EURO III and incorporate the potential for EURO IV. Further engineering targets were: Compactness; Favorable power/cost relation; Low weight; Low fuel consumption; and Low noise level. The targeted standards have been reached, for instance, through the application of modern computation and simulation methods. The design configuration of the engines will be described and it will be outlined by examples how the engineering targets have been reached. Particular emphasis will be on measures for noise emission reduction. The 4-valve cylinder head will be described in detail. Injection, combustion and turbocharging will be presented with regard to the

achieved exhaust emission standards and the envisaged engine performance. The results of specific wear tests demonstrate how the objective of a long engine life has been substantiated. *The Effect of Heated Diesel Fuel on Particulate Generation and Fuel Consumption for a Deutz FL 912W Engine* Franklin Classics Trade Press Individual pamphlets and miscellaneous papers concerning the company and its various engines inserted in a ring binder. *Mianus Diesel and Gasoline Engines* MacMillan Publishing Company This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1919 edition. Excerpt:

...where the cylinders are secured to the crank-case by a studded flange the staybolts if fitted at all may be made considerably lighter, according to judgment or the results of experiment. Other points to be considered in designing a crank-case are: --(1) The provision of oil-tight access doors of ample size for overhauling the bottom ends. (2) End casings provided with oil flingers, stuffing boxes, or other means of preventing the escape of oil. (3) Facings, and other necessary accommodation for valve gear. (4) Bosses to carry lubrication oil connections to the main bearings. (5) Facings for platform brackets. (6) A vent pipe or valve of large area, to relieve pressure in the event of an explosion in the crank-case without loss of lubricating

oil during normal working. (7) Steady pins to each section of the case, to fix correct location. Machining the Framework generally.--In designing all parts of an engine the designer will keep in mind the capabilities and limitations of the manufacturing plant and the operatives. This is especially necessary in the case of the framework, on account of the relatively large size of the parts. Where the most modern type of face milling plant is available the element of size offers no difficulties, and bedplates of 60 feet in length may be faced in one operation. Where planing must be resorted to the capacity of the machines must be studied in the early stages of the design. Machined faces should be arranged in as few different planes as possible, and ribs or flanges projecting

beyond those planes are to be avoided as much for convenience in machining as for the sake of appearances. The simpler forms of girder or box-girder construction are to be preferred to those designs in which alternate perforation by..
