Diverse cellular processes depend on weak interactions between

biological components. In this volume, we bring together a wealth of recent information on this topic, combining original research articles with up-to-date reviews, organized under four separate themes. In our first section on nucleic acid regulation, we include a study of the PII-NAGK-PipX-NtcA regulatory axis of cyanobacteria and discover much about the role of RNA binding protein regulation and cross-talk in the control of AU-rich mRNA. Peptide-mediated weak interactions are our

second theme in which we review weak molecular interactions in clathrin-mediated endocytosis, investigate the selectivity of the G7-18NATE inhibitor peptide for the Grb7-SH2 domain target and present new structure and interactions of the TPR domain of Sgt2 with yeast chaperones and Ybr137wp. Our third part focuses on carbohydrates and includes a thorough review of how to use NMR to study transient carbohydrate - protein binding and a structural and functional study of lysostaphin - substrate interaction. In our final section, we look at

functional sensors driving weak interactions by presenting the molecular basis of the dual regulation of bacterial iron sulfur cluster biogenesis by CyaY and IscX alongside a review of intramolecular fuzzy interactions involving intrinsically disordered domains. Taken together, our eBook chapters offer some recent insight into this area of scientific understanding which is still expanding exponentially.
