Contemporary scholarship and classic essays focus on the continuing crises in bureaucratic organizations and managerial authority. Rethinking and innovation in private, public, and nonprofit organizations emerge from case studies on schools, multicultural and feminist organizations, private corporations, environmental planning and regulation, alternative services, and attempts to "reinvent government." Author note: Frank Fischer teaches Political Science and Public Administration at Rutgers University and has published several books, including *Technocracy and the Politics of Expertise* and *The Argumentative Turn in Policy Analysis and Planning*. Carmen Sirianni teaches Sociology at Brandeis University and is co-editor of the *Labor and Social Change* series at Temple University Press. His books include *Worker Participation and the Politics of Reform* (Temple) and *Working Time in Transition* (Temple).

Critical Studies in Organization and Bureaucracy John Wiley & Sons

Although there are many textbooks in the field of educational administration describing various organizational theories, this text is unique in tying organizational theory explicitly and systematically to a well-formulated problem-analysis methodology. It provides particular examples of bureaucratic, political, and leadership theories as well as descriptions of two broader theoretical frameworks: Burrell and Morgan's conceptual matrix and systems thinking. Special features include: * a fully developed methodology for describing and documenting problems in schools; * a systematic method for using different theoretical perspectives to analyze the causes of problems in schools; * carefully formulated questions illustrating how different theoretical frameworks lead policy analysts to look at problems differently and to focus on different types and sources of information concerning their possible causes; * substantial sample papers illustrating the methodology; and * a range of illustrative organizational theories, amply described and succinctly grounded intellectually. This book is directed toward students in organizational theory and problem analysis classes and their professors, as well as to school administrators seeking to examine their problems and policies from perspectives that go beyond personal experience.

Introductory Statistics is designed for the one-semester, introduction to statistics course and is geared toward students majoring in fields other than math or engineering. This text assumes students have been exposed to intermediate algebra, and it focuses on the applications of statistical knowledge rather than the theory behind it. The foundation of this textbook is Collaborative Statistics, by Barbara Illowsky and Susan Dean. Additional topics, examples, and ample opportunities for practice have been added to each chapter. The development choices for this textbook were made with the guidance of many faculty members who are deeply involved in teaching this course. These choices led to innovations in art, terminology, and practical applications, all with a goal of increasing relevance and accessibility for students. We strove to make the discipline meaningful, so that students can draw from it a working knowledge that will enrich their future studies and help them make sense of the world around them. Coverage and Scope Chapter 1 Sampling and Data Chapter 2 Descriptive Statistics Chapter 3 Probability Topics Chapter 4 Discrete Random Variables Chapter 5 Continuous Random Variables Chapter 6 The Normal Distribution Chapter 7 The Central Limit Theorem Chapter 8 Confidence Intervals Chapter 9 Hypothesis Testing with One Sample Chapter 10 Hypothesis Testing with Two Samples Chapter 11 The Chi-Square Distribution Chapter 12 Linear Regression and Correlation Chapter 13 F Distribution and One-Way ANOVA

This book is a result of collaboration between NTLIS and SITTE. Framing Research is targeted at individuals or small teams of educational researchers who are interested in conducting high quality research addressing the effects of technology-enhanced instruction on student learning. The book summarizes and unpacks the methodologies of a variety of research studies, each situated in the context of school subject areas, such as science, mathematics, social studies, and English/language arts, as well as in the contexts of reading education, special education, and early childhood learning. Taken together, the analyses provide guidance on the design of future technology research grounded in student learning of K12 curriculum. The conclusions also serve as a tool for teacher educators seeking to prepare teachers to integrate technology effectively in their instruction and to motivate reluctant teachers to overcome perceived inconveniences connected with technology use.

This is the second in a series of three volumes dealing with important topics in algebra. Volume 2 is an introduction to linear algebra (including linear algebra over rings), Galois theory, representation

theory, and the theory of group extensions. The section on linear algebra (chapters 1–5) does not require any background material from Algebra 1, except an understanding of set theory. Linear algebra is the most applicable branch of mathematics, and it is essential for students of science and engineering. As such, the text can be used for one-semester courses for these students. The remaining part of the volume discusses Jordan and rational forms, general linear algebra (linear algebra over rings), Galois theory, representation theory (linear algebra over group algebras), and the theory of extension of groups follow linear algebra, and is suitable as a text for the second and third year students specializing in mathematics.

Understanding Elementary Algebra with Geometry John Wiley & Sons

The integration of constructivist instructional methods and activities into mathematics curricula has been shown to aid in student understanding of many topics. This study examined the use of constructivist instructional methods and activities, including the use of The Geometer's Sketchpad, a dynamic geometry construction and exploration tool. The purpose of this study was to determine whether constructivist instructional methods increased students' mathematical achievement in geometry at the college preparatory level and at the honors level. The sample was drawn from geometry classes at a public high school in Connecticut. The control group at the college preparatory level contained 50 students in two classes, while the treatment group at the college preparatory level contained 20 students in one class. The control group at the honors level contained 38 students in two classes, while the treatment group at the honors level contained 25 students in one class. The researcher taught all six classes used in the study. All college preparatory classes followed the same curriculum, used the same textbook, and took the same department-wide unit test on polygon properties. All honors classes followed the same curriculum, used the same textbooks, and took the same department-wide unit test on polygon properties. The college prep test scores for the unit on polygon properties were compared in order to establish that the college preparatory control group and college preparatory treatment group were statistically equivalent. The honors test scores for the unit test on polygon properties were also compared in order to establish that the honors control group and honors treatment group were statistically equivalent. During the study, student results were compared based on data collected from the unit test on circle properties. College preparatory test scores for the circle property unit were compared to previous college preparatory test scores for the circle property unit, and honors test scores for the circle property unit were compared to previous honors test scores for the circle property unit. The results of the study indicated that there was no statistical difference between the academic performance of the college preparatory control and treatment groups. The results of the study indicated that the honors level control group outperformed the honors level treatment group on the unit test on circle properties. The difference was statistically significant. The results of this study did not indicate that constructivist instructional methods increased student academic performance. Honors level student academic performance decreased during the study.

Now in paperback, Paine's essential American writings in authoritative Library of America texts: After a life of obscurity and failure in England, Thomas Paine came to America in 1774 at age 37. Within fourteen months he published Common Sense, the most influential pamphlet of the American Revolution, and began a career that would see him hailed and reviled in the American nation he helped create. In Common Sense, Paine sets forth an inspiring vision of an independent America as an asylum for freedom and an example of popular self-government in a world oppressed by despotism and hereditary privilege. The American Crisis, begun during "the times that try men's souls" in 1776, is a masterpiece of popular pamphleteering in which Paine vividly reports current developments, taunts and ridicules British adversaries, and enjoins his readers to remember the immense stakes of their struggle. They are joined in this invaluable reader by a selection of Paine's other American pamphlets and his letters to George Washington, Thomas Jefferson, and others.
