specimens based on the absorbance of light by organic molecules. Light is shed on the under study tissue and the reflected spectra from wavelengths between 400 and 2400 nm enables detailed qualitative and quantitative analysis of chemical synthesis. In vitro and ex vivo studies have shown that NIRS can help discriminate between stable and unstable plaques.

near Infrared Spectroscopy - an overview | ScienceDirect ...Near-infrared spectroscopy (NIRS) is a spectroscopic method that uses the near-infrared region of the electromagnetic spectrum (from 780 nm to 2500 nm). Typical applications include medical and physiological diagnostics and research including blood sugar, pulse oximetry, functional neuroimaging, sports medicine, elite sports training, ergonomics, rehabilitation, neonatal research, brain ...Near-infrared spectroscopy - WikipediaVisible near-infrared spectroscopy is a well-established analytical method for examining food materials. The attraction of this technology is that it is low cost, robust, and measurements can be

made very fast and usually without damaging or even touching the sample.

Near-infrared spectroscopy BASICS: - Specific chemical bonds absorb energy in the NIR spectrum. - The amount of energy absorbed by the compound is related to the amount in the sample (i.e. it is quantitative) - Samples are scanned using a near infrared spectrophotometer that both emits NIR light and detects it.

Near Infrared Spectroscopy - An OverviewNear infrared spectroscopy is a fast and non-destructive (vibrational spectroscopy based) technique for studying many multi-constituent chemical systems, namely for gasoline. It covers the wavelength range adjacent to the mid-infrared and extends up to the visible region (4000 to 12500 cm^{-1}).

near Infrared Spectroscopy - an overview | ScienceDirect ...near infrared spectroscopy an overview Near-infrared spectroscopy (NIRS) is a technique based on two principles. First, light in the near-infrared zone can pass through the thin skin, bone, and other tissues of the infant. Second, the appropriate choice of near-infrared

wave-lengths allows interpretation of changes in light.

Near Infrared Spectroscopy An Overview | calendar.pridesourceNear infrared spectroscopy (NIRS) is an analytical technique that uses a source producing light of known wavelength pattern (usually 800-2500nm) and that enables one to obtain a complete picture of the organic composition of the analysed substance/material (Van Kempen, 2001).
