Behavioural Methods in Consciousness Research Elsevier
 The Neuropsychology of Consciousness is based on a symposium entitled "Consciousness and Cognition: Neuropsychological Perspectives held at the University of St Andrews, September 1990. The intention was to assemble a group of the major researchers at the forefront of this field. The starting point for the symposium and for the book was the widespread realization that in several areas of human cognition (e.g. visual perception, memory, language comprehension, and attention), the severe and profound impairments due to brain damage that have been described over the past 150 years are often not absolute. In particular, the use of indirect methods of testing may reveal unsuspected preservation of capacities that are undetected by more traditional direct methods. The book opens with a discussion of the epidemic of dissociations and how well the phenomena within either neuropsychology or within normal human experimental psychology map onto each other. This is followed by separate chapters on topics such as blindsight, covert visual processing in patients, face recognition and awareness following brain injury, and the relationship between the study of attention and the understanding of consciousness.

 'Behavioral Methods in Consciousness Research' is the first book of its kind, providing an overview of methods and approaches for studying consciousness. The chapters are written by leading researchers and experts, who describe the methods they actually use in their own studies, along with their pitfalls, problems, and difficulties.--Back cover.
Deciphering How the Brain Codes Our Thoughts Columbia University Press
 The Cambridge Handbook of Consciousness is the first of its kind in the field, and its appearance marks a unique time in the history of intellectual inquiry on the topic. After decades during which consciousness was considered beyond the scope of legitimate scientific investigation, consciousness re-emerged as a popular focus of research towards the end of the last century, and it has remained so for nearly 20 years. There are now so many different lines of investigation on consciousness that the time has come when the field may finally benefit from a book that pulls them together and, by juxtaposing them, provides a comprehensive survey of this exciting field. An authoritative desk reference, which will also be suitable as an advanced textbook.
Fragments of Mind and Brain Routledge
 Current mainstream opinion in psychology, neuroscience, and philosophy of mind holds that all aspects of human mind and consciousness are generated by physical processes occurring in brains. The present volume demonstrates empirically that this reductive materialism is not only incomplete but false. The authors systematically marshal evidence for a variety of psychological phenomena that are extremely difficult, and in some cases clearly impossible, to account for in conventional

physicalist terms.

Psychology: The Science of Mind and Behaviour 6th Edition John Benjamins Publishing

In this book David Chalmers follows up and extends his thoughts and arguments on the nature of consciousness that he first set forth in his groundbreaking 1996 book, *The Conscious Mind*.

Alterations of Consciousness Macmillan

A renowned philosopher of the mind, also known for his groundbreaking work on Buddhism and cognitive science, Evan Thompson combines the latest neuroscience research on sleep, dreaming, and meditation with Indian and Western philosophy of mind, casting new light on the self and its relation to the brain. Thompson shows how the self is a changing process, not a static thing. When we are awake we identify with our body, but if we let our mind wander or daydream, we project a mentally imagined self into the remembered past or anticipated future. As we fall asleep, the impression of being a bounded self distinct from the world dissolves, but the self reappears in the dream state. If we have a lucid dream, we no longer identify only with the self within the dream. Our sense of self now includes our dreaming self, the "I" as dreamer. Finally, as we meditate—either in the waking state or in a lucid dream—we can observe whatever images or thoughts arise and how we tend to identify with them as "me." We can also experience sheer awareness itself, distinct from the changing contents that make up our image of the self. Contemplative traditions say that we can learn to let go of the self, so that when we die we can witness its dissolution with equanimity. Thompson weaves together neuroscience, philosophy, and personal narrative to depict these transformations, adding uncommon depth to life's profound questions. Contemplative experience comes to illuminate scientific findings, and scientific evidence enriches the vast knowledge acquired by contemplatives.

In this accessible overview of current knowledge, an expert team of editors and authors describe experimental approaches to consciousness. These approaches are shedding light on some of the hitherto unknown aspects of the distinct states of human consciousness, including the waking state, different states of sleep and dreaming, meditation and more. The book presents the latest research studies by the contributing authors, whose specialities span neuroscience, neurology, biomedical engineering, clinical psychology and psychophysiology, psychosocial medicine and anthropology. Overall this anthology provides the reader with a clear picture of how different states of consciousness can be defined, experimentally measured and analysed. A future byproduct of this knowledge may be anticipated in the development of systematic corrective treatments for many disorders and pathological problems of consciousness.

"This book is designed to help students organize their thinking about psychology at a conceptual level. The focus on behaviour and empiricism has produced a text that is better organized, has fewer chapters, and is somewhat shorter than many of the leading books. The beginning of each section includes learning objectives; throughout the body of each section are key terms in bold followed by their definitions in italics; key takeaways, and exercises and critical thinking activities end each section"--BCcampus website.

From one of the world's leading neuroscientists: a succinct, illuminating, wholly engaging investigation of how biology, neuroscience, psychology, and artificial intelligence have given us the tools to unlock the mysteries of human consciousness In recent decades, many philosophers and cognitive scientists have declared the problem of consciousness unsolvable, but Antonio Damasio is convinced that recent findings across multiple scientific disciplines have given us a way to understand consciousness and its significance for human life. In the forty-eight brief chapters of *Feeling & Knowing*, and in writing that remains faithful to our intuitive sense of what feeling and experiencing are about, Damasio helps us understand why being conscious is not the same as sensing, why nervous systems are essential for the development of feelings, and why feeling opens the way to consciousness writ large. He combines the latest discoveries in various sciences with philosophy and discusses his original research, which has transformed our understanding of the brain and human behavior. Here is an indispensable guide to understanding how we experience the world within and around us and find our place in the universe.

The Cambridge Handbook of Consciousness Academic Press

The relation between subjective consciousness and the physical brain is widely regarded as the last mystery facing science. This book argues that there is no real puzzle here. Consciousness seems mysterious, not because of any hidden essence, but only because we think about it in a special way. David Papineau exposes the resulting potential for confusion, and shows that much scientific study of consciousness is misconceived. Modern physical science strongly supports a materialist account of consciousness. But there remains considerable resistance to this, both in philosophy and in the way most people think about the mind; we fall back on a dualist view, that consciousness is not part of the material world. Papineau argues that resistance to materialism is groundless. He offers a detailed analysis of the way human beings think about consciousness, and in particular the way in which we humans think about our conscious states by activating those selfsame states. His careful account of this distinctive mode of phenomenal thinking enables him, first, to show that the standard arguments against dualism are unsound, second, to explain why dualism is nevertheless so intuitively persuasive, and third, to expose much contemporary scientific study of consciousness as resting on a confusion. In placing a materialist account of consciousness on a firm foundation, this clear and forthright book lays many traditional problems to rest, and offers escape from immemorial misconceptions about the mind.

This book presents an analytic investigation into the nature of cognitive reality. The author explores various manifestations of consciousness with rational and empirical rigor; he begins with more ordinary states such as thinking, sleeping, and dreaming and then continues on with more extraordinary states such as hypnosis, trance, psychedelic experiences, transcendence, and experiences associated with death. This comprehensive overview of altered states examines consciousness from the physiological, cognitive, and experiential points of view. Readers will gain from this text an enriched understanding of consciousness, reality, and the scientific endeavor. (PsycINFO Database Record (c) 2004 APA, all rights reserved).

Is there a theory that explains the essence of consciousness? Or is consciousness itself an illusion? Am I conscious now? Now considered the 'last great mystery of science', consciousness was once viewed with extreme scepticism and rejected by mainstream scientists. It is now a significant area of research, albeit a contentious one, as well as a rapidly expanding area of study for students of psychology, philosophy, and neuroscience. This edition of *Consciousness*, revised by author team Susan Blackmore and Emily Troscianko, explores the key theories and evidence in consciousness studies ranging from neuroscience and psychology to quantum theories and philosophy. It examines why the term 'consciousness' has no recognised definition and provides an opportunity to delve into personal intuitions about the self, mind, and consciousness. Featuring comprehensive coverage of all core topics in the field, this edition includes: Why the problem of consciousness is so hard Neuroscience and the neural correlates of consciousness Why we might be mistaken about our own minds The apparent difference between conscious and unconscious Theories of attention, free will, and self and other The evolution of consciousness in animals and machines Altered states from meditation to drugs and dreaming Complete with key concept boxes, profiles of well-known thinkers, and questions and activities suitable for both independent study and group work, *Consciousness* provides a complete introduction to this fascinating field. Arousal in Neurological and Psychiatric Diseases focuses on the dysregulation of arousal found in many neurological and psychiatric disorders. Chapters describe the physiology of each process, how it presents in each disorder, and the most appropriate treatment(s). The book also imparts the understanding of the RAS as a system that not only modulates waking, but also survival mechanisms, such as fight vs. flight responses and other reflexes. This book helps neuroscientists, sleep researchers, neurologists and psychiatrists understand the basic mechanisms that modulate arousal in health and disease. In addition, it promotes therapies that can alter the severity and manifestation of multiple disorders. Provides a comprehensive overview of the basic mechanisms behind dysregulation of arousal in neurological and psychiatric disorders Describes, in detail, the function of the Reticular Activating System with respect to higher functions, motor control and the intertwining of arousal and motor disorders Covers multiple neurological disorders, including epilepsy, Alzheimer's disease, Parkinson's disease and autism

Following the text's content, Richard Straub offers a Chapter Overview and Chapter Review, which is divided by major section. Each group of fill-in-the-blank and short-answer questions is preceded by the relevant objective from the text. The Study Guide also includes three self-tests (one of which encourages students to think critically about the chapter's concepts), answers (with page references for the self-tests and explanations of why a choice is correct or incorrect), and a Focus on Language and Vocabulary section, which explains idioms and other phrases used by David Myers in the text that may not be clear to some readers. *Inner Sound* Routledge

Consciousness, 'the last great mystery for science', remains a hot topic. How can a physical brain create our experience of the world? What creates our identity? Do we really have free will? Could consciousness itself be an illusion? Exciting new developments in brain science are continuing the debates on these issues, and the field has now expanded to include biologists, neuroscientists, psychologists, and philosophers. This controversial book clarifies the potentially confusing arguments, and the major theories, whilst also outlining the amazing pace of discoveries in neuroscience. Covering areas such as the construction of self in the brain, mechanisms of attention, the neural correlates of consciousness, and the physiology of altered states of consciousness, Susan Blackmore highlights our latest findings.
