In 1981 Victor Hassine was sentenced to prison for life without parole for a capital offense. This book is an insightful look at conditions of confinement and prison life in America today. Hassine powerfully conveys the changes in prison life which have come about as a result of the use of drugs, prison overcrowding, and demographic changes in inmate populations. Topics covered include rape, prison gangs, prison violence, AIDS, homosexuality, and prison politics. The second edition features five new chapters that explore crucial topics expanding on the first edition, graphically documenting the extreme violence that is a part of everyday life in a men's maximum-high security prison. A new appendix offers details about the capital crime for which Hassine received a life-without-parole sentence. The new edition of an introductory text that teaches students the

art of computational problem solving, covering topics ranging from simple algorithms to information visualization. This book introduces students with little or no prior programming experience to the art of computational problem solving using Python and various Python libraries, including PyLab. It provides students with skills that will enable them to make productive use of computational techniques, including some of the tools and techniques of data science for using computation to model and interpret data. The book is based on an MIT course (which became the most popular course offered through MIT's OpenCourseWare) and was developed for use not only in a conventional classroom but in in a massive open online course (MOOC). This new edition has been updated for Python 3, reorganized to make it easier to use for courses that cover only a subset of the material, and offers additional material including five new chapters. Students are introduced to Python and the basics of programming in the context of such computational concepts and techniques as exhaustive enumeration, bisection search, and efficient approximation algorithms. Although it covers such traditional topics as computational complexity and simple algorithms, the book focuses on a wide range of topics not found in most introductory texts, including information visualization, simulations to model randomness, computational techniques to understand data, and statistical techniques that inform (and misinform) as well as two related but relatively advanced topics: optimization problems and dynamic programming. This edition offers expanded material on statistics and machine learning and new chapters on Frequentist and Bayesian statistics.
