Digital Coding of Waveforms Speech coding is an application of data compression of digital audio signals containing speech. Speech coding uses speech-specific parameter estimation using audio signal processing techniques to model the speech signal, combined with generic data compression algorithms to represent the resulting modeled parameters in a compact bitstream. Speech coding - Wikipedia Specifies the coded representation of high quality audio for storage media and the method for decoding of high quality audio signals. Is intended for application to digital storage media providing a total continuous transfer rate of about 1,5 Mbit/s for both audio and video bitstreams, such as CD, DAT and magnetic hard disc, and for sampling rates of 32 kHz, 44,1 kHz, and 48 kHz. The basic task of a perceptual audio coding system is to compress the digital audio data in a way that - the compression is as efficient as possible, i.e. the compressed file is as small as possible and - the reconstructed (decoded) audio sounds exactly (or as close as possible) to the original audio before compression.
