### **Advanced Paediatric Life Support**

John Wiley & Sons

Unless dealing with injury regularly, few surgeons can attain and sustain the level of skill necessary for decision making in major trauma. This includes both the intellectual decisions and the manual dexterity required to perform all the manoeuvres needed for surgical access and control. These can be particularly challenging, and may be infrequently required, yet rapid access to and control of sites of haemorrhage following trauma can be life-saving surgical intervention. Many situations require specialist trauma expertise, yet often this is simply not on hand within the available time frame. Manual of Definitive Surgical Trauma

Care, Second Edition, is written by the editorial board of the DSTCTM, which is a short course focusing on the life-saving surgical techniques and surgical decision-making required for surgeons who deal with major surgical trauma on an infrequent basis. This course supplements the well-recognized and accepted American College of Surgeons' Advanced Trauma Life Support (ATLS®) course. This manual is published in association with IATSIC (the International Association for the Surgery of Trauma and Surgical Intensive Care), and is written by an Editorial Board of surgeons who belong to that society. IATSIC are broadening their reach and running more and more courses worldwide. This new second edition has been updated to incorporate all recent developments in

this rapidly progressing area. It emphasizes how practical 'real-life' decisions on the care of the injured patient should be made and then covers in practical terms the surgical techniques required. Every aspect of surgical trauma care is covered, including: ·the causation of injuries - aids rapid understanding of presented trauma; ·the initial, pre-hospital and emergency department care of the patient - all of which may determine eventual outcome; ·the resources required, both physical and intellectual, within the hospital to deal with the specific problems associated with patients with multiple injuries; the limitations in providing specialist expertise within the time frame required. It is an ideal practical manual for both

trainees and qualified surgeons.

*Damage Control Resuscitation* iUniverse  
This new edition of the Care of the Critically Ill Surgical Patient (CCrISP) course manual has been fully updated and revised by a multidisciplinary team of surgeons and anaesthetists. It remains true to the original aims of the course: to encourage trainees to take responsibility for critically ill patients, to

predict and prevent problems that patients might encounter while in hospital, to function well within the surgical team and communicate effectively with colleagues from other disciplines. CCrISP is a valuable adjunct to traditional ward training and continues to provide young surgeons with the structure and confidence they require to safely and effectively care for their patients on the ward and in theatre. Designed to develop skills that are necessary in the management of critically ill patients, CCrISP integrates knowledge, practical skills, communication and leadership.

This book provides a comprehensive overview of damage control resuscitation (DCR), an evidence-based approach to the resuscitation of patients with severe life-threatening hemorrhage (LTH). It focuses on both civilian and military applications as DCR is utilized in civilian trauma situations as well as combat casualty care settings. The book covers the history of fluid resuscitation for bleeding, epidemiology of severe traumatic injuries, prediction of life-threatening hemorrhage, pathophysiology and diagnosis of blood failure, and permissive hypotension. Chapters provide in-depth detail on hemostatic resuscitation principles, dried plasma, dried platelet surrogates, and recent developments in frozen red blood cells and oxygen carriers. The book also

discusses how DCR principles can be used in a variety of situations such as when there are large numbers of patients with hemorrhagic lesions, non-trauma scenarios, and on distinct populations such as children. Finally, it concludes with a discussion of training and education methods for the implementation of DCR and remote DCR principles as well as learning healthcare system principles to facilitate the implementation of DCR and ultimately improve outcomes for patients with life-threatening hemorrhage. *Damage Control Resuscitation: Identification and Treatment of Life-Threatening Hemorrhage* is an essential resource for physicians and related professionals, residents, nurses and medical students in emergency medicine, anesthesia,

Extremity Trauma John Wiley & Sons  
Tactical Combat Casualty Care (TCCC) has saved hundreds of lives during our nation's conflicts in Iraq and Afghanistan. Nearly 90 percent of combat fatalities occur before a casualty reaches a medical treatment facility. Therefore, the prehospital phase of care is needed to focus on reducing the number of combat deaths. However, few military physicians have had training in this area and, at the

onset of hostilities, most combat medics, corpsmen, and pararescue personnel in the U.S. military have been trained to perform battlefield trauma care through civilian-based trauma courses. These courses are not designed for the prehospital combat environment and do

not reflect current practices in the area of prehospital care. TCCC was created to train Soldiers and medical personnel on current best practices for medical treatment from the point of injury to evacuation to Role 3 facilities
