*Camberwell Assessment of Need for the Elderly* Cambridge University Press

How can positive psychology approaches help us to understand the process of adjustment to, and living well with dementia? As accounts of positive experiences in dementia are increasingly emerging, this book reviews current evidence and explores how psychological constructs such as hope, humour, creativity, spirituality, wisdom, resilience and personal growth may be linked with wellbeing and quality of life in dementia. Expert contributors from a range of academic and clinical backgrounds examine the application of positive psychological concepts to dementia and dementia care practice. The lived experiences of people with dementia are central to the book, and their voices bring life to the ideas explored, highlighting how positive experiences in dementia and dementia care are possible.

**Dementia Rehabilitation** Routledge

We seek to throw down the gauntlet with this handbook, challenging the hegemony of the "behavioral medicine" approach to the psychological study and treatment of the physically ill. This volume is not another in that growing surfeit of texts that pledge allegiance to the doctrinaire purity of behavioristic thinking, or conceptualize their subject in accord with the sterility of medical models. Diseases are not our focus, nor is the narrow band of behavioral assessment and therapy methodologies. Rather, we have sought to redefine this amorphous, yet burgeoning field so as to place it squarely within the province of a broadly-based psychology—specifically, the emerging, substantive discipline of health psychology and the well-established professionalism and diverse technologies of clinical psychology. The handbook's title—Clinical Health Psychology—reflects this reorientation explicitly, and Chapter 1 addresses its themes and provides its justifications more fully. In the process of developing a relevant and comprehensive health assessment tool, the editors were struck by the failure of clinical psychologists to avail themselves of the rich vein of materials that comprise the psychosocial world of the physically ill. Perhaps more dismaying was the observation that this field was being mined—less than optimally—by physicians and nonclinical psychologists.

**Evidence-Based Interventions and Clinical Recommendations** Aging and Mental Health Research

Els sistemes assistits per robots per a la rehabilitació cognitiva poden augmentar l'abast dels beneficis potencials de les intervencions psicològiques o psicosocials basades en l'evidència per a persones amb una àmplia gamma de problemes de salut mental. Les investigacions existents a la socialment assistits robots (SAR) manquen de validació clínica i, per tant, els metges tenen poca motivació per al seu ús en pràctiques clíniques. A més, les interaccions entre humans i robots existents no tenen en compte l'estat emocional i la involucració actuals de l'usuari. Les intervencions de rehabilitació cognitiva per a persones amb problemes de salut mental requereixen una interacció complexa entre robots i humans, i la ubicuïtat dels dispositius portàtils, motiva l'ús de

sistemes d'interacció amb robots capaços d'adquirir de forma autònoma informació sobre l'estat emocional de l'usuari, les intencions i el context circumdant perquè el robot pugui adaptar les interaccions en conseqüència. En aquesta tesi, he descrit el disseny, la implementació de les activitats de rehabilitació cognitiva assistides per robot i el reconeixement d'emocions en temps real a partir de senyals d'electro-dermal activity (EDA). El disseny d'intervencions assistides per robot presenta un marc coherent per produir efectes positius tant als usuaris com als cuidadors. La implementació del sistema confirma una major involucració entre els usuaris i una reducció significativa en la càrrega dels cuidadors. El desenvolupament dels algorismes de reconeixement d'emocions ha demostrat que és possible processar els senyals EDA en temps real amb un retard mínim per inferir l'estat emocional de les persones amb discapacitat intel·lectual (DI).

**Positive Psychology Approaches to Dementia** Jessica Kingsley Publishers

*Cognitive Stimulation Therapy for Dementia* History, Evolution and Internationalism Routledge

**Making a Difference : an Evidence-based Group Programme to Offer Cognitive Stimulation Therapy (CST) to People with Dementia : the Manual for Group Leaders**

Frontiers Media SA

"This book is to be recommended for anybody who is interested in a multi-, inter- or even cross-disciplinarian approach to care for dementia. It might also be useful for a non-professional audience also because it is extremely didactic and accessible." *International Journal of Integrated Care*, Feb 2012

**Ordinary Lives, Extraordinary People** Jessica Kingsley Publishers

The first authoritative reference on clinical psychology and aging, the *Handbook of the Clinical Psychology of Ageing* was universally regarded as a landmark publication when it was first published in 1996. Fully revised and updated, the Second Edition retains the breadth of coverage of the original, providing a complete and balanced picture of all areas of clinical research and practice with older people. Contributions from the UK, North America, Scandinavia and Australia provide a broad overview of the psychology of aging, psychological problems (including depression, anxiety, psychosis, and dementia), the current social service context, and assessment and intervention techniques.

*Early Psychosocial Interventions in Dementia* Cognitive Stimulation Therapy for Dementia History, Evolution and Internationalism

Cognitive Stimulation Therapy (CST) has made a huge global, clinical impact since its inception, and this landmark book is the first to draw all the published research together in one place. Edited by experts in the intervention, including members of the workgroup who initially developed the therapy, *Cognitive Stimulation Therapy for Dementia* features contributions from authors across the globe, providing a broad overview of the entire research programme. The book demonstrates how CST can significantly improve cognition and quality of life for people with dementia, and offers insight on the theory and mechanisms of change, as well as discussion of the practical implementation of CST in a range of clinical settings. Drawing from several research studies, the book also includes a section on culturally adapting and translating CST, with case studies from

countries such as Japan, New Zealand and Sub-Saharan Africa. Cognitive Stimulation Therapy for Dementia will be essential reading for academics, researchers and postgraduate students involved in the study of dementia, gerontology and cognitive rehabilitation. It will also be of interest to health professionals, including psychologists, psychiatrists, occupational therapists, nurses and social workers.

*Clinical Topics in Old Age Psychiatry* Routledge

Nearly 44 million people have Alzheimer's or related dementia worldwide, according to the Alzheimer's Disease International organization. That number is expected to double every 20 years. Unlike other books on the market, *Alzheimer's Disease: Understanding Biomarkers, Big Data, and Therapy* covers recent advancements in cognitive, clinical, neural, and therapeutic aspects of Alzheimer's and other forms of dementia. First, readers are introduced to cognitive and clinical studies, focusing on the different types of memory impairment, past and future thinking. This includes the prevalence of depression, its relationship to other symptoms, and the quality of life for those with Alzheimer's disease. In addition, the book discusses recent studies on memory dysfunction in advanced-stage Alzheimer's disease, in comparison to early-stage, including a chapter on the underlying factors in the transition from mild cognitive impairment to Alzheimer's diagnosis. Following this section, the book presents recent studies on the role of different cortical and subcortical structures in the development of various symptoms in Alzheimer's disease, as well as different neural biomarkers underlying the development and treatment of the disease. In the last section of the book, therapeutic aspects of Alzheimer's disease, focusing on behavioral and pharmacological treatments of sleep disorders, memory problems, and depression, are reviewed. The book aids readers in understanding the advances in research and care, making it a prime tool for all clinicians, psychologists, researchers, neurologists, and caregivers of dementia patients.

Reviews recent developments of cognitive and clinical studies  
Covers factors underlying the transition from mild cognitive impairment to Alzheimer's disease  
Discusses different neural biomarkers underlying the development and treatment of Alzheimer's disease  
Provides a comparison of the effectiveness of various types of treatments

*Excellence in Dementia Care* Routledge

This proceedings volume provides a snapshot of the latest issues encountered in technical convergence and convergences of security technology. It explores how information science is core to most current research, industrial and commercial activities and consists of contributions covering topics including Ubiquitous Computing, Networks and Information Systems, Multimedia and Visualization, Middleware and Operating Systems, Security and Privacy, Data Mining and Artificial Intelligence, Software Engineering, and Web Technology. The proceedings introduce the most recent information technology and ideas, applications and problems related to technology convergence, illustrated through case studies, and reviews converging existing security techniques. Through this volume, readers will gain an understanding of the current state-of-the-art in information strategies and technologies of convergence security. The intended readership are researchers in academia, industry, and other research institutes focusing on information science and technology.

*Cognitive Assessment for Clinicians* BoD - Books on Demand

The third edition of the best-selling *Cognitive Assessment for Clinicians* provides readers with an up-

to-date, practical guide to cognitive function and its assessment to ensure readers have a conceptual knowledge of normal psychological function and how to interpret their findings. Organized into 8 chapters, this resource offers a framework in which various aspects of cognition are considered. This includes the representation of cognition in the brain (such as attention and memory), focal representation (such as language, praxis and spatial abilities), detailed descriptions of the major syndromes encountered in clinical practice, and discussions on taking a patient's history and performing cognitive testing. To ensure readers are aware of the latest developments in patient assessment and neuropsychological practice all content has been carefully revised by John R. Hodges to include essential updates on areas such as the pathology and genetics of frontotemporal dementia, and social cognition and major syndromes encountered in clinical practice such as delirium. This useful resource offers a theoretical basis for cognitive assessment at the bedside or in the clinic, and a practical guide to taking an appropriate history and examining patients presenting with cognitive disorders. This edition also includes the latest version of Addenbrooke's Cognitive Examination III (ACE-III), and 16 case histories on a variety of cognitive disorders illustrating the method of assessment and how to use the ACE-III in clinical practice. In addition, the appendix outlines the range of formal tests commonly used in neuropsychological practice.

**Timely Psychosocial Interventions in Dementia Care** Psychology Press

This fourth edition contains all the latest research on the use of the PAL Instrument, new information on using the PAL Checklist to carry out sensory interventions and information about how a new online PAL tool supports the book. It features photocopiable activity checklists and plans that help to match users' abilities with activities.

*CANE* Oxford Library of Psychology

The relevance of cognitive rehabilitation for people with dementia is becoming increasingly accepted by researchers and practitioners in the field. This special issue draws together examples of state-of-the-art research and systematic review by experts in this exciting and growing area. The contributors show how cognitive rehabilitation approaches can be applied, in different ways, to help optimise functioning and address specific difficulties across the full spectrum of severity. While the main focus is on the more commonly diagnosed forms of dementia, treatment possibilities for people with fronto-temporal dementia are also explored. Cognitive rehabilitation interventions need to be grounded in a clear assessment of the profile of strengths and limitations in cognitive functioning, and to demonstrate where possible that treatment effects extend beyond improvement on target measures to have a meaningful impact on wellbeing and quality of life. For this reason, the special issue includes contributions that explore detailed aspects of cognitive functioning or describe new developments in evaluating quality of life in dementia. Cognitive rehabilitation, it is suggested, should be viewed as one important component of a holistic approach to helping people with dementia, their families, and those who care for them. This special issue seeks both to provide information about what has already been achieved and to encourage and stimulate further progress.

*An Evidence-based Group Programme to Offer Cognitive Stimulation Therapy (CST) to People with Dementia : the Manual for Group Leaders* Academic Press

The control of balance by the central nervous system is crucial to maintain our posture and perform

efficiently our daily motor tasks. This control requires the development of dynamical phenomena sub-served by highly-coordinated patterns of muscle activation/deactivation disseminated throughout the whole-body and called “postural adjustments”. Establishing the interaction between balance control, locomotion and cognition has important clinical implication, especially in term of falls prevention, and will improve our knowledge on the underlying neural correlates. This Research Topic provides an up-to-date picture of the relationship between postural adjustments, body balance and motor performance in healthy (young and older adults) and pathological participants. It includes 36 contributions (1 editorial, 28 original articles, 4 reviews and 3 methods articles) which are separated into four sections: 1. Postural maintenance and multisensory integration, 2. Anticipatory postural adjustments associated with voluntary movement, 3. Postural adjustments associated with predictable and unpredictable external perturbation, 4. Gait assessment and rehabilitation in aging. Beside their basic interest of unveiling the mechanisms behind motor control, results from the investigations of this topic are relevant to develop new methods or tools to improve postural stability and motor performance, with applications in the fields of neurodegenerative conditions, rehabilitation, ergonomics and sports sciences.

*4th International Conference, iLRN 2018, Missoula, MT, USA, June 24-29, 2018, Proceedings* Springer Science & Business Media

This book presents a psychotherapy intervention model called Multimodal Integrative Cognitive Stimulation Therapy (MICST). It is grounded in information processing and cognitive stimulation techniques and operates out of a positive psychology framework. This model, designed for group work with clients with schizophrenia, can be easily tailored to working with clients in individual therapy sessions. The three core MICST group activities include: 1) body movement-mindfulness-relaxation (BMR); 2) cognitive stimulation using group discussions; and 3) cognitive stimulation using paper-pencil cognitive exercises and self-reflection exercises. A chapter is devoted to each of these core areas with actual case vignettes to illustrate ways that these activities can be implemented in clinical practice. Homework recommendations are included at the end of each chapter, devoted to a core MICST group activity and providing suggestions on ways to practice various skills and exercises in between group sessions. Also provided are several handouts and worksheets which can be used with clients.

*Cognitive Stimulation Therapy for Dementia* Wiley

This new edited volume seeks to meet the growing need for ways to support people with dementia across the whole course and trajectory of dementia care, with a wide scope of expertise. The book addresses how practitioners and carers can apply psychosocial interventions - which take into consideration the individual, social and environmental aspects of a person's life - across this trajectory, right from the earliest stages through to practice in care home settings. Divided into four sections, each covers a different context in which people with dementia can be supported: at home; in community settings; family and carer support; and those in care homes and hospitals. In addition, there is a distinct focus throughout on evidence-based practice and its implementation in real-world settings. This book is essential reading for any practitioner and caregiver wanting to support people with dementia.

**The Development and Evaluation of a Maintenance Cognitive Stimulation Therapy (CST)**

**Programme for People with Dementia** Jessica Kingsley Publishers

Rehabilitation helps individuals maintain and optimize independence. Historically, people with dementia have received little rehabilitation and the focus has been on care to replace lost function. Dementia Rehabilitation is a resource for health and social professionals, service planners, policy makers, and academics. The book makes a compelling case for rehabilitation for people with dementia, including the views of people with dementia and the research evidence. For each area of function, the research evidence and relevant theory is summarized, followed by practical information on clinical assessment, and delivery of therapies. Identifies rehabilitation as a human right for people with dementia. Reviews functions affected by dementia, including cognition, communication, and physical function. Outlines evidence-based strategies to maintain function and to delay decline. Describes how to maintain activities of daily living and leisure activities. Includes techniques to maintain self-identity and mood. Recognizes the importance of environment and care partners in supporting rehabilitation. Summarizes models of care for rehabilitation.

*Reducing the Impact of Dementia in America* Jessica Kingsley Publishers

Drugs are being developed to alleviate the symptoms of dementia and different models of care are being tried. This book is a reference work in the subject. It gives a basis of the disease, its epidemiology, care implications, development and use of drugs. It discusses the challenges of obtaining reliable data and reviews the tools used to assess the costs of dementia to date. It also deals with the pharmacoeconomics of dementia.

**Handbook of Clinical Health Psychology** John Wiley & Sons

The Camberwell Assessment of Need for the Elderly (CANE) is an internationally accepted tool for assessing the needs of older people. Needs are assessed in twenty-four areas of life and cover a broad range of health, social and psychological domains. Two items that measure the needs of those who care for the older person are also included. The CANE is suitable for use in research, clinical practice and for evaluating health and social services provided to older people. It has been used for over twenty years in a range of settings, populations and countries. This book outlines the evidence for its use in effectively measuring the needs of older people across primary care, community, inpatient and care home settings. Both the full version CANE and short version (CANE-S) are included, along with a detailed manual and scoring guidance. The assessment forms are freely available to download from [researchintorecovery.com/can](http://researchintorecovery.com/can) and [cambridge.org](http://cambridge.org).

*My Mood Stars* Academic Press

My Mood Stars is a book that encourages children to talk about their feelings. This delightful book asks questions that encourage your child to talk about their feelings. There is space for notes on each page to record your child's thoughts and then look back on in days to come. This book does not come with My Mood Stars and board.

*Cognitive Stimulation Therapy (CST) for People with Dementia* John Wiley & Sons

Cognitive Stimulation Therapy (CST) has made a huge global, clinical impact since its inception, and this landmark book is the first to draw all the published research together in one place. Edited by experts in the intervention, including members of the workgroup who initially developed the therapy, Cognitive Stimulation Therapy for Dementia features contributions from authors across the globe, providing a broad overview of the entire research programme. The book demonstrates how

CST can significantly improve cognition and quality of life for people with dementia, and offers insight on the theory and mechanisms of change, as well as discussion of the practical implementation of CST in a range of clinical settings. Drawing from several research studies, the book also includes a section on culturally adapting and translating CST, with case studies from countries such as Japan, New Zealand and Sub-Saharan Africa. Cognitive Stimulation Therapy for

Dementia will be essential reading for academics, researchers and postgraduate students involved in the study of dementia, gerontology and cognitive rehabilitation. It will also be of interest to health professionals, including psychologists, psychiatrists, occupational therapists, nurses and social workers.
