Aircraft Stability And Automatic Control Aircraft Stability And Automatic Control It is mainly the job of the vertical tailplane (the fin) to provide directional stability, and without the fin most aircraft would be incredibly difficult to fly if not outright unstable. Lateral Stability By lateral stability we are referring to the stability of the aircraft when rolling one wing down/one wing up, and vice versa. Stability is the ability of an aircraft to correct for conditions that act on it, like turbulence or flight control inputs. For aircraft, there are two general types of stability: static and dynamic. Most aircraft are built with stability in mind, but that's not always the case. Some aircraft, like training airplanes, are built to be very stable. The 3 Types Of

Static And Dynamic Aircraft Stability ...A stability augmentation system (SAS) is another type of automatic flight control system; however, instead of maintaining the aircraft on a predetermined attitude or flight path, the SAS will actuate the aircraft flight controls to dampen out aircraft buffeting regardless of the attitude or flight path. Aircraft stability is the tendency of an aircraft to return to a state of equilibrium after a perturbation. Typically, a coordinate system is attached to the center of gravity of the aircraft in order to describe the dynamics or response to perturbations. This is done because forces acting on an airplane create moments and rotations naturally about the center of gravity. Aircraft Stability | Georgia Tech Fixed Wing Design Class ...
