This book investigates the relationship between ideas about childhood and the actual experience of being a child, and assesses how it has changed over the span of five hundred years. Hugh Cunningham tells an engaging story of the development of ideas about childhood from the Renaissance to the present, taking in Locke, Rosseau, Wordsworth and Freud, revealing considerable differences in the way western societites have understood and valued childhood over time. His survey of parent/child relationships uncovers evidence of parental love, care and, in the frequent cases of child death, grief throughout the period, concluding that there was as much continuity as change in the actual relations of children and adults across these five centuries. For undergraduate courses in History of the Family, European Social History, History of Children and Gender History.

Earth as an Evolving Planetary System, Second Edition, examines the various subsystems that play a role in the evolution of the Earth. These subsystems include such components as the crust, mantle, core, atmosphere, oceans, and life. The book contains 10 chapters that discuss the structure of the Earth and plate tectonics; the origin and evolution of the crust; the processes that leave tectonic imprints in rocks and modern processes responsible for these imprints; and the structure of the mantle and the core. A Paradigm of Earth and Biological Origins by Intelligent Design Earth System History

Since this new science is of an unprecedented interdisciplinary nature, the book does not merely take stock of its numerous ingredients, but also delivers their multifaceted integration. The resulting master paradigm - the co-evolution of nature and anthroposphere within a geo-cybernetic continuum of processes - is based on a structured manifold of partial paradigms with their specific ranges. Most importantly, this serves the scientific foundation of a meaningful, safe and efficient environment and development management for solving the most burning questions concerning humankind and its natural environment. The more concrete elucidation of the natural and human dimensions, as well as various attempts and instruments of integration are represented in the different parts of the book, while the didactic quality is heightened by many allegoric illustrations.

Integrating Science for Sustainability Oxford University Press

Faith, Reason, and Earth History presents Leonard Brand¿s argument for constructive thinking about origins and earth history in the context of Scripture, showing readers how to analyze available scientific data and approach unsolved problems. Faith does not need to fear the data, but can contribute to progress in understanding earth history within the context of God¿s Word while still being honest about unanswered questions. In this patient explanation of the mission of science, the author models his conviction that ¿above all, it is essential that we treat each other with respect, even if we disagree on fundamental issues.¿ The original edition of this work (1997) was one of the first books on this topic written from the point of view of an experienced research scientist. A career biologist, paleontologist, and teacher, Brand brings to this well-illustrated book a rich assortment of practical scientific examples. This thoughtful and rigorous presentation makes Brand¿s landmark work highly useful both as a college-level text and as an easily accessible treatment for the educated lay person.

A Guide to the Sites and their Extraordinary Biotas Academic Press

When humanity first glimpsed planet Earth from space, the unity of the system that supports humankind entered the popular consciousness. The concept of the Earth's atmosphere, biosphere, oceans, soil, and rocks operating as a closely interacting system has rapidly gained ground in science. This new field, involving geographers, geologists, biologists, oceanographers, and atmospheric physicists, is known as Earth System Science. In this Very Short Introduction, Tim Lenton considers how a world in which humans could evolve was created; how, as a species, we are now reshaping that world; and what a sustainable future for humanity within the Earth System might look like. Drawing on elements of geology, biology, chemistry, physics, and mathematics, Lenton asks whether Earth System Science can help guide us onto a sustainable course before we alter the Earth system to the point where we destroy ourselves and our current civilisation. ABOUT THE SERIES: The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area. These pocket-sized books are the perfect way to get ahead in a new subject quickly. Our expert authors combine facts, analysis, perspective, new ideas, and enthusiasm to make interesting and challenging topics highly readable.
