Feasibility Studies in Construction
Projects covers all aspects of feasibility
study analysis including assumptions,
the preparation of a feasibility study for
submission, and the necessary elements
to consider regarding the project cycle.

The book also provides templates for use in preparing a feasibility study report. The book offers the reader a step by step guide on how to prepare a feasibility study for a large infrastructure project, showing how problems can be presented in a way which does not prejudice the ultimate outcome of the project. It shows the reader how to identify the weaknesses of a project and make improvements, set assumptions, anticipate and prepare for various

eventualities. It further shows how to test the sensitivity of the development as to changes in the original assumptions and business environment, convince prospective investors, venture capitalists, banks, management, stockholders, and government agencies of the relative value or prospects for success of the project. Finally the book explains the vital parts of a project development process and show how the pieces are assembled so they perform together to create a technical and economically feasible concept, thus evaluating the project's potential for success. Offering the reader a step by step guide on how to prepare a feasibility study for a large infrastructure project, this book will be of great interest to engineers, architects, lenders,

solicitors, construction project managers, lead developers, investors, governmental planning agencies, stakeholders, and construction bond underwriters as well as construction students.

Given the significance of a feasibility study in decision making and implementation of the project, many people especially potential investors, financiers or even management lack the practical knowledge of feasibility study. In this regard, it becomes difficult to write a feasibility study which will provide a road map for a particular project. Based on this notion, this book

sets to address those practical challenges in preparing a feasibility study. The purpose of the book is to provide practical guide to write a feasibility study to determine the viability of a specific project. Specifically, this will book will provide the description of every important section in a feasibility study with vivid illustration.

Economic Feasibility Studies Springer

This book presents a set of tools that will aid in deciding whether a project should go ahead, be improved, or abandoned altogether by pinpointing its vulnerabilities. It offers a review of project feasibility analysis, and more critically, psychodynamic aspects that are often neglected, including how stakeholders interact. It provides a complement to the common techniques used for analyzing technical, financial, and marketing feasibility. The goal is to identify "hidden truths" and eliminate those gray areas that jeopardize the success of a given project. The focus is on uncovering points of vulnerabilities in four key aspects of a project: People, Power, Processes, and Plan.

A Compendium of Project Feasibility Studies diplom.de

“Everything” sums up what must be considered for a properly documented property evaluation. Less than 30% of the projects that are developed in the minerals industry yield the return on investment that was projected from the project feasibility studies. The tools described in this handbook will greatly improve the probability of meeting your projections and minimizing project execution capital cost blowout that has become so prevalent in this industry in recent years. Mineral Property Evaluation provides guidelines to follow in performing mineral property feasibility and evaluation studies and due

diligence, and in preparing proper documents for bankable presentations. It highlights the need for a consistent, systematic methodology in performing evaluation and feasibility work. The objective of a feasibility and evaluation study should be to assess the value of the undeveloped or developed mineral property and to convey these findings to the company that is considering applying technical and physical changes to bring the property into production of a mineral product. The analysis needs to determine the net present worth returned to the company for investing in these changes and to reach that decision point as early as possible and with the least amount of money spent on the evaluation study. All resources are not reserves, nor are all minerals an ore. The

successful conclusion of any property evaluation depends on the development, work, and conclusions of the project team. The handbook has a diverse audience:

- Professionals in the minerals industry that perform mineral property evaluations.
- Companies that have mineral properties and perform mineral property feasibility studies and evaluations or are buying properties based on property evaluation.
- Financial institutions, both domestic and overseas, that finance or raise capital for the minerals industry.
- Consulting firms and architectural and engineering contractors that utilize mineral property feasibility studies and need standards to follow.
- And probably the most important, the mining and geological engineering students and geology and

economic geology students that need to learn the standards that they should follow throughout their careers.

This is a textbook for engineering and management/business undergraduates and postgraduate students and a reference for practicing engineers or managers who are familiar with their projects but less familiar with financial/economic analysis methods. The book is divided into two parts. Part 1 covers all the basic concepts and theories and provides the readers with a good understanding of the financial and economic analysis on the feasibility of

projects. Plenty of examples are used to illustrate the theories, arguments and calculations. Part 2 consists of case studies on both financial and economic feasibility studies. Readers should be able to conduct their own financial and economic analyses by following the procedures and methodology of the examples given. In this new edition, the chapters have been revised and expanded with the latest theories and data added, especially the most updated information on the development of the theories of internal rate of return and net present worth.

The Ethics of Redistribution was originally delivered as a Boutwood Lecture at Corpus Christi College,

Cambridge, in the autumn of 1949. The Baron Bertrand de Jouvenel was then an already internationally regarded philosopher whose learned style was a calculated blend of moral, historical and political considerations. In this essay, split between discussions of the socialist ideal and state expenditure, he presents the fraught economic, societal and ethical implications attendant upon the question of income redistribution.

Feasibility Studies Made Simple B. T. Batsford Limited

This publication describes the various elements to be included in a comprehensive, robust and logically structured feasibility study report for a new research reactor project. It provides guidance for the main supporting organization or team of a new research reactor to enable them to undertake an authoritative and comprehensive feasibility study that could be submitted to decision makers for their review in order to support proposals and endorse an action plan for construction of such a facility. It includes considerations of justification for a new research reactor, associated key nuclear infrastructure issues, cost-benefit analysis and risk management that would have to be

addressed prior to authorizations for the establishment of a new research reactor. Addressing these issues will help Member States to develop a comprehensive understanding of all the roles, obligations and commitments involved in establishing and operating a research reactor and ensure that these are met during all phases of the project life cycle. The publication also includes a generic template for preparing a feasibility study report and provides some examples and lessons learned from individual Member States in preparing such studies.

Economic Decision Analysis GRIN Verlag
This book explores the working principles of all kinds of turbomachines. The same theoretical framework is used to analyse the different machine types.

Fundamentals are first presented and theoretical concepts are then elaborated for particular machine types, starting with the simplest ones. For each machine type, the author strikes a balance between building basic understanding and exploring knowledge of practical aspects. Readers are invited through challenging exercises to consider how the theory applies to particular cases and how it can be generalised. The book is primarily meant as a course book. It teaches fundamentals and explores applications. It will appeal to senior undergraduate and graduate students in mechanical engineering and to professional engineers seeking to understand the operation of turbomachines. Readers will gain a fundamental understanding of

turbomachines. They will also be able to make a reasoned choice of turbomachine for a particular application and to understand its operation. Basic design of the simplest turbomachines as a centrifugal fan, an axial steam turbine or a centrifugal pump, is also possible using the topics covered in the book.

Preparation of a Feasibility Study for New Nuclear Power Projects Routledge
This is the first comprehensive guide to the design of behavioral randomized

clinical trials (RCT) for chronic diseases. It includes the scientific foundations for behavioral trial methods, problems that have been encountered in past behavioral trials, advances in design that have evolved, and promising trends and opportunities for the future. The value of this book lies in its potential to foster an ability to “speak the language of medicine” through the conduct of high-quality behavioral clinical trials that match the rigor commonly seen in double-blind drug trials. It is relevant for testing any treatment aimed at improving a behavioral, social, psychosocial, environmental, or policy-level risk factor for a chronic disease including, for example, obesity, sedentary behavior, adherence to treatment, psychosocial stress, food

deserts, and fragmented care. Outcomes of interest are those that are of clinical significance in the treatment of chronic diseases, including standard risk factors such as cholesterol, blood pressure, and glucose, and clinical outcomes such as hospitalizations, functional limitations, excess morbidity, quality of life, and mortality. This link between behavior and chronic disease requires innovative clinical trial methods not only from the behavioral sciences but also from medicine, epidemiology, and biostatistics. This integration does not exist in any current book, or in any training program, in either the behavioral sciences or medicine.
