This open access book makes a case for a socially inclusive energy transition and illustrates how engineering and public policy professionals can contribute to shaping an inclusive energy transition, building on a socio-technical systems engineering approach. Accomplishing a net-zero greenhouse gas emissions economy in 2050 is a daunting challenge. This

book explores the challenges of the energy transition from the perspectives of technological innovation, public policy, social values and ethics. It elaborates on two particular gaps in the design of public policy interventions focused on decarbonization of the energy system and discusses how both could be remedied. First, the siloed organization of public administration fails to account for the many interdependencies between the energy sector, the mobility

system, digital infrastructure and the built environment. Cross-sector coordination of policies and policy instruments is needed to avoid potentially adverse effects upon society and the economy, which may hamper the energy transition rather than accelerate it. Second, energy and climate policies pay insufficient attention to the social values at stake in the energy transition. In addressing these gaps, this book intends to inspire decision makers

engaged in the energy transition to embrace the transition as an opportunity to bring a more inclusive society into being.

Press

Presents information about the Delft University of Technology (TU Delft), located in The Netherlands. Includes an overview and history of the university, as well as information on courses and degrees available. Offers information about research opportunities in

the university's various faculties and disciplines. Describes facilities available to university students and staff. Links to related Internet sites.

**Demographic Change and Housing Wealth:**

Springer Science & Business Media

This book reports new results in condensed matter physics for which topological methods and ideas are important. It considers, on the one hand, recently discovered systems such as carbon nanocrystals and, on the other hand, new

topological methods used to describe more traditional systems such as the Fermi surfaces of normal metals, liquid crystals and quasicrystals. The authors of the book are renowned specialists in their fields and present the results of ongoing research, some of it obtained only very recently and not yet published in monograph form.

 Policy analysts love solving complex problems. Their favorite problems are not just technically complex but

also characterized by the presence of many different social actors that hold conflicting interests, objectives, and perceptions and act strategically to get the best out of a problem situation. This book offers guidance for policy analysts who want to assess if and how their analysis could be of help, based on the premise that problem formulation is the cornerstone in addressing complex problems. This book positions policy analysis within the theories on processes of

policy making, and focuses on methods and techniques for structuring complex problems. The book takes a systems perspective as its basis, complemented by techniques for analyzing multi-actor systems, and for dealing with an uncertain future. Analytical results are then interpreted and used for problem formulation. In the last part of the book, the resulting problem formulation is used to diagnose meaningful follow-up activities, including potential in-

depth policy analysis research. This book is firmly embedded in problem structuring theory, but also shows the tricks of the trade, the assumptions underlying practice, the choices that need to be made, and the dilemmas encountered by the analyst. The authors are involved in teaching problem structuring methods and policy analysis at the Faculty of Technology, Policy and Management of Delft University of Technology. Their interdisciplinary approach to problem

formulation reflects their multi-disciplinary backgrounds, which range from physics, informatics and land-use planning to public administration and the philosophy of technology. Introduction to Policy Analysis of Multi-Actor Systems 11 1 Introduction 13 1.1 The Challenge of Policy Analysis in Multi-Actor Systems 13 1.2 The Problem Formulation Focus 14 1.2.1 Problem Formulation in Problem Solving 15 1.2.2 Policy Problems: Gaps and Dilemmas 16 1.3 Policy

Science & Business Media  
Across the EU,  
populations are shrinking  
and ageing. An increasing  
burden is being placed on  
a smaller working  
population to generate  
the taxes required for  
pensions and care costs.  
Welfare states are  
weakening in many  
countries and across

Europe, households are being increasingly expected to plan for their retirement and future care needs within this risky environment. At the same time, the proportion of people buying their own home in most countries has risen, so that some two-thirds of European households now own their homes. Housing equity now considerably exceeds total European GDP. This book discusses questions like: to what extent might home ownership provide a potential cure for some of

the consequences of ageing populations by realizing housing equity in order to meet the consumption needs of older people? What does this mean for patterns of inheritance and longer-term inequalities across Europe? And to what extent are governments banking on their citizens utilising their housing wealth now and in the future?

**Living Stations** BIS  
Publishers

Since the 1970s, cities world-wide have been witness to radical de-

industrialisation. Manufacturing was considered incompatible with urban life and was actively pushed out. As economies have grown, public officials and developers have instinctively shifted their priorities to short-term, high-yielding land uses such as offices, retail space and housing. Inner-city growth from New York to London and even Seoul have generally come at the expense of land uses such as manufacturing or logistics. Despite the odds, manufacturing is

not in terminal decay in western cities. On the contrary, it is at the opening of a new chapter. Urban manufacturing can help cities to be more innovative, circular, inclusive and resilient. Recently, with increasing interest in the circular economy, with cleaner and more compact technology, with more progressive building codes for mixed use, with increasing awareness of the impacts of social inequality and with a clearer understanding of the value chains between

the trade of material and immaterial goods, cities across the world are realising that manufacturing has an important place in the 21st century urban economy. While both enthusiasm for making is increasing and the value of manufacturing is becoming increasingly evident in cities, the topic remains extremely complex and challenging to manage. This book attempts to shed light on the ways manufacturing can address urban challenges, it exposes

constraints for the manufacturing sector and provides fifty patterns for working with urban manufacturing. This book has been written as a manual to help politicians, public authorities, planners, designers and community organisations to be able to plan, discuss and collaborate by developing more productive urban manufacturing. The book is split into two parts. "**Design Strategies and Methods** Bloomsbury Publishing  
The Prototype Laboratory

initiated and maintained by the Chair of Product Development at the Faculty of Architecture, TU Delft, has set an example in architectural education for hands-on 'learning-by-making' for students. According to the authors of this book, in the current curriculums time spent on practical work is not rewarded and students are educated in an abstract concept of architecture, not getting a proper feeling for materialization. A semester of designing, engineering, producing

and building a prototype with their own hands after their own design often gives students a boost in their education. The Delft Prototype laboratory was the base of around 1,000 students, now professionals. Some architect's offices make prototypes regularly as their designs are quite experimental and require more insight for the designing architect, before the realization of his building. Prototypes of technical components are often developed parallel to the building process.

The Prototype Laboratory at the Faculty of Architecture was supervised for almost 18 years by Peter van Swieten. He describes his experiences in this book, in collaboration with the initiator, professor Mick Eekhout. Marcel Bilow took over the Bucky Lab, as it is called, from 2012 onwards.

*Emerging Technologies and Applications* John Wiley & Sons

Sand, clay and rock have to be excavated for a variety of purposes, such as dredging, trenching,

mining (including deep sea mining), drilling, tunnel boring and many other applications. Many excavations take place on dry land, but they are also frequently required in completely saturated conditions, and the methods necessary to accomplish them consequently vary widely. This book provides an overview of cutting theories. It begins with a generic model, valid for all types of soil (sand, clay and rock), and continues with the specifics of dry sand, water-saturated

sand, clay, atmospheric rock and hyperbaric rock. Small blade angles and large blade angles are discussed for each soil type, and for each case considered the equations/model for cutting forces, power and specific energy are given. With models verified by laboratory research, principally from the Delft University of Technology, and data from other recognized sources, this book will prove an invaluable reference for anybody whose work involves major

excavations of any kind.

### **Design Roadmapping**

IOS Press

Since the education of aeronautical engineers at Delft University of Technology started in 1940 under the inspiring leadership of Professor H.J. van der Maas, much emphasis has been placed on the design of aircraft as part of the student's curriculum. Not only is aircraft design an optional subject for thesis work, but every aeronautical student has to carry out a preliminary airplane design in the course of his

study. The main purpose of this preliminary design work is to enable the student to synthesize the knowledge obtained separately in courses on aerodynamics, aircraft performances, stability and control, aircraft structures, etc. The student's exercises in preliminary design have been directed through the years by a number of staff members of the Department of Aerospace Engineering in Delft. The author of this book, Mr. E. Torenbeek, has made a large contribution to this

part of the study programme for many years. Not only has he acquired vast experience in teaching airplane design at university level, but he has also been deeply involved in design-oriented research, e.g. developing rational design methods and systematizing design information. I am very pleased that this wealth of experience, methods and data is now presented in this book.

Synthesis of Subsonic Airplane Design Springer  
"Institute of History of Art,

Architecture & Urbanism, Delft University of Technology--Faculty of Architecture"--P. facing t.p.

The Impact of Co-production John Wiley & Sons

This volume addresses the governance and evolution of Canada's international policies, and the challenges facing Canada's international policy relations on multiple fronts.

An introduction to the preliminary design of subsonic general aviation and transport aircraft,

with emphasis on layout, aerodynamic design, propulsion and performance IOS Press

The mission of the publication Delft Science in Design is to promote and advance the exchange of lessons learned on design between university and industry. Also, it aims to amplify the visibility of the results of academic effort in design at Delft University. The questions “What is design?”, “What is engineering?”, “What is science?” can be fiercely debated. Between the

extremes of artistic design and pure science, the transitions are like in fluid: they are smooth and gradual. An approach focusing on how the university deals with knowledge may provide a better entry to the debate. The mutual understanding between scientists from different disciplines may get lost. It is one of the two major objectives of the Delft Science in Design congress to offer a kaleidoscope of the activities of the various faculties to all university

colleagues and students, so that staff and students can be made aware of activities in other laboratories, and have the opportunity to be informed on details. Being informed is the first step to understanding.

*Designing for Society*

Springer Science & Business Media

This book presents research results of PowerWeb, TU Delft’s consortium for interdisciplinary research on intelligent, integrated energy systems and their role in markets and

institutions. In operation since 2012, it acts as a host and information platform for a growing number of projects, ranging from single PhD student projects up to large integrated and international research programs. The group acts in an inter-faculty fashion and brings together experts from electrical engineering, computer science, mathematics, mechanical engineering, technology and policy management, control engineering, civil engineering, architecture,

aerospace engineering, and industrial design. The interdisciplinary projects of PowerWeb are typically associated with either of three problem domains: Grid Technology, Intelligence and Society. PowerWeb is not limited to electricity: it bridges heat, gas, and other types of energy with markets, industrial processes, transport, and the built environment, serving as a singular entry point for industry to the University's knowledge. Via its Industry Advisory Board, a steady link to

business owners, manufacturers, and energy system operators is provided.

### **Challenging Glass**

McGraw-Hill College

This comprehensive textbook takes you through everything you need to know about solar energy from the physics of photovoltaic (PV) cells through to the design of PV systems for real-life applications. Solar Energy is an invaluable reference for researchers, industrial engineers and designers working in solar energy generation. The book is

also ideal for university and third-level physics or engineering courses on solar photovoltaics, with exercises to check students' understanding and reinforce learning. It is the perfect companion to the Massive Open Online Course (MOOC) on Solar Energy (DelftX, ET.3034TU) presented by co-author Arno Smets. The course is available in English on the nonprofit open source edX.org platform, and in Arabic on edraak.org. Over 100,000 students have already registered for these

MOOCs. **Guidebook for Future Foresight Techniques** Bentham Science Publishers Bringing together academics, artists, practitioners and 'community activists', this book explores the possibilities for, and tensions of, social justice work under the contemporary drive for community-orientated 'impact' in the academy. Threading a line between celebratory accounts of institutionalised community engagement,

self-professed 'radical' scholarship for social change and critical accounts of the governmentalisation of community, the book makes an original contribution to all three fields of scholarship. Showcasing experimental research and co-production practices taking place in the UK, Australia, Sweden and Canada and within universities, independent research organisations and internationally prestigious museums and galleries, the book

considers what research impact could look like for a wide range of audiences and how universities could engage with different publics in ways that would be relevant and useful, but may not necessarily be easily measurable. Asking hard questions of the current impact agenda, the book offers an insight into emerging routes towards co-production for social justice.

**Liber Amicorum for Hans de Jonge** Eleven International Pub  
With contributions from

an internationally-renowned group of experts, this book uses a multidisciplinary approach to review recent developments in the field of smart sensor systems, covering important system and design aspects. It examines topics over the whole range of sensor technology from the theory and constraints of basic elements, physics and electronics, up to the level of application-orientated issues. Developed as a complementary volume to 'Smart Sensor Systems'

(Wiley 2008), which introduces the basics of smart sensor systems, this volume focuses on emerging sensing technologies and applications, including: State-of-the-art techniques for designing smart sensors and smart sensor systems, including measurement techniques at system level, such as dynamic error correction, calibration, self-calibration and trimming. Circuit design for sensor systems, such as the design of precision instrumentation

amplifiers. Impedance sensors, and the associated measurement techniques and electronics, that measure electrical characteristics to derive physical and biomedical parameters, such as blood viscosity or growth of micro-organisms. Complete sensor systems-on-a-chip, such as CMOS optical imagers and microarrays for DNA detection, and the associated circuit and micro-fabrication

techniques. Vibratory gyroscopes and the associated electronics, employing mechanical and electrical signal amplification to enable low-power angular-rate sensing. Implantable smart sensors for neural interfacing in biomedical applications. Smart combinations of energy harvesters and energy-storage devices for autonomous wireless sensors. Smart Sensor

Systems: Emerging Technologies and Applications will greatly benefit final-year undergraduate and postgraduate students in the areas of electrical, mechanical and chemical engineering, and physics. Professional engineers and researchers in the microelectronics industry, including microsystem developers, will also find this a thorough and useful volume.
