Using Error Analysis for Intervention and Assessment R.I.C. Publications
 Linguists routinely emphasise the primacy of speech over writing. Yet, most linguists have analysed spoken language, as well as

language in general, applying theories and methods that are best suited for written language. Accordingly, there is an extensive 'written language bias' in traditional and present day linguistics and other language sciences. In this book, this point is argued with rich and convincing evidence from virtually all fields of linguistics.
Math Made a Bit Easier Workbook Corwin Press
 This is the second book in the Math Made a Bit Easier series by independent math tutor Larry Zafran. It is a workbook of practice exercises, self-tests, and review notes to be used in conjunction with the first book in the series, subtitled Basic Math Explained in Plain English. The math content in this book is directly aligned with the first book. It covers the topics which comprise the foundation of math. It begins with practice in basic arithmetic, followed by basic operations, negative numbers, fractions, decimals, percents, and basic probability and statistics. If these topics are not completely mastered, later work will prove to be quite difficult. This is especially true of algebra. An extensive

introduction describes how to obtain the greatest benefit from the book. The book also outlines practical techniques for attaining the optimal mindset for studying math and improving scores on exams. An answer key for all exercises and self-tests is included.
