A concise full-color

review of the
mechanisms of blood
diseases and disorders
- based on a Harvard
Medical School
hematology course 4
STAR DOODY'S
REVIEW! "This is a
superb book.
Deceptively small, yet

packs a wallop. The emphasis on principles instead of practice is welcome....The text is clear, concise, and surprisingly approachable for what could have been a very dense and dry discussion. I could not put this book down and read it entirely in one sitting. When was the last time anyone found a hematology textbook so riveting?"--Doody's Review Service

Hematological Pathophysiology is a well-illustrated, easy-to-absorb introduction to the physiological principles underlying the regulation and function of blood cells and hemostasis, as well as the pathophysiologic mechanisms responsible for the development of blood disorders. Featuring a

strong emphasis on key principles, the book covers diagnosis and management primarily within a framework of pathogenesis. Authored by world-renowned clinician/educators at Harvard Medical School, Hematological Pathophysiology features content and organization based on a hematology course offered to second year students at that school. The book is logically divided into four sections: Anemias and Disorders of the Red Blood Cell, Disorders of Hemostasis and Thrombosis, Disorders of Leukocytes, and Transfusion Medicine; it opens with an important overview of blood and hematopoietic tissues. Features Succinct, to-

the-point coverage that reflects current medical education. More than 200 full-color photographs and renderings of disease mechanisms and blood diseases. Each chapter includes learning objectives and self-assessment questions. Numerous tables and diagrams encapsulate important information. Incorporates the feedback of 180 Harvard medical students who reviewed the first draft -- so you know you're studying the most relevant material possible.
