CDTi is the emissions technology leader - reducing exhaust emissions from on- and off-road engine applications. CDTi globally deploys advanced exhaust catalyst technologies to reduce harmful exhaust emissions from light-duty gasoline, heavy-duty diesel, natural gas, bio-fuels and other applications. CDTi Exhaust Emissions Control Leaders In diesel engines, primary application is to control NOx emissions. Commonly used in many light- and heavy-duty duty diesel engines. High pressure EGR delivery can introduce a fuel consumption penalty through higher pumping losses. Low pressure EGR has lower pumping losses but is more difficult to control during transient operation. Engine Emission Control - DieselNet The learning objectives of this video are that the learner will:

- Know the requirements for a basic fuel system for a diesel engine.
- Know the various components in a diesel engine fuel system.

Diesel Engine Fuel Systems The Wärtsilä UNIC engine control system for diesel engines is a durable, all-inclusive, automation system designed especially for the harsh environment in which engines operate. The UNIC engine control system provides an engine-mounted, local control panel that includes a display unit with the engine's operating data, and an hour counter. With its in-built redundancy and durable mechanical and electrical design, the UNIC system meets the highest reliability requirements. Wärtsilä UNIC engine control system for diesel engines An engine control unit, also commonly called an engine control module, is a type of electronic control unit that controls a series of actuators on an internal combustion engine to ensure optimal engine performance. It does this by reading values from a multitude of sensors within the engine bay, interpreting the data using multidimensional performance maps, and adjusting the engine actuators.
