RANDOLPH SKYLAR

*Netter Atlas of Human Anatomy and
Dorland's Illustrated Medical Dictionary
Package* Springer

The main themes of the Symposium were biodiversity in enclosed and semi-enclosed seas and artificial habitats, and the restoration of degraded systems. These themes are highly relevant today. The papers dealing with the first theme represent current research and concerns about marine biodiversity in enclosed seas. The papers in the second theme represent a synthesis of up-to-date knowledge on artificial habitats.

Ceroplastics Science History Publications/USA

Representing the latest knowledge of the ecology and the physiology of cold-adapted microorganisms, plants and animals, this book explains the mechanisms of cold-adaptation on the enzymatic and molecular level, including results from the first crystal structures of enzymes of cold-adapted organisms.

A Companion to Cosimo I De' Medici Guilford Publications

This is the first monograph on computation in living cells - one of the central and fastest growing areas of research in this field. Gene assembly in ciliates (unicellular organisms) is a splendid example of such computations. This work has helped to clarify important biological aspects of gene assembly,

yielded novel insights into the nature of computation, and broadened our understanding of what computation is about. The monograph gives an accessible account of both the biology and the formal analysis of the gene assembly process. It can be used as a textbook for either graduate courses or seminars.

Fractals and Chaos in Geology and Geophysics Springer Science & Business Media

This volume represents the third edition of a work cycle that started in 2006 for my PhD thesis. The thesis was presented in 2010 (first edition, Gattiglia 2010), partially published as a summary monograph in 2011 (second edition, Gattiglia 2011) or in articles (Gattiglia 2012, Gattiglia 2012a, Gattiglia 2011a), and now (third edition) takes the form of a more comprehensive publication in the light of new data. Over the past two years, the work study on Pisa, not only relating to the Middle Ages, continued within the MAPPa (Metodologie Applicate alla Predittività del Potenziale -

Methodologies Applied to Archaeological Potential Predictivity) project, allowing a widespread collection of data thanks to which it was possible to explain more fully the hydro-geological, geomorphological and topographic context and to check (and in many cases change) part of the assumptions made.

The Intangible Elements of Culture in Ethnoarchaeological Research

Springer

Neuroeconomics, neuromarketing, neuroaesthetics, and neurotheology are

just a few of the novel disciplines that have been inspired by a combination of ancient knowledge along with recent discoveries about how the human brain works. This fascinating and thought provoking new book critically questions our love affair with brain imaging.

News in Early Modern Europe Biota Publishing

The Antarctic fish fauna has evolved over a long period of geographic and climatic isolation. In the course of this evolution, Antarctic fish have developed specialized adaptations, some of which characterize these organisms as unique. In strong contrast to the continental shelf faunas elsewhere, the Antarctic shelf ichthyofauna is dominated by a single highly endemic group, the Notothenioidei. This group of perciform fish probably first appeared and diversified in the early Tertiary. The development of the Polar Front (referred to as the Antarctic Convergence in the older literature) resulted in a natural oceanographic barrier to migration in either direction, and thus became a key factor in the evolution of Antarctic fish. The dominance of the Antarctic continental shelf fauna by a single taxonomic group of fish provides a simplified natural laboratory for exploring the wealth of physiological, biochemical and ecological adaptations that characterize the fauna. Understanding of the patterns of adaptation in this highly specialized group of fish can tell us much about evolution.

Linnaeus in Italy Springer Nature

This presentation describes various aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the

cardiorespiratory system. The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection, where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion. Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or PO₂ on the cell surface falls to a critical level of about 4-5 mm Hg. Thus, in order to meet the energetic needs of cells, it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO₂. In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of regulation to ensure survival of all tissues under a wide range of circumstances. The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved.

Cone Beam Computed Tomography in Orthodontics Oxford University Press

This volume focuses on the intangible elements of human cultures, whose relevance in the study of archaeology has often been claimed but rarely practiced. In this book, the authors successfully show how the adoption of ethnoarchaeological perspectives on

non-material aspects of cultures can support the development of methodologies aimed at refining the archaeological interpretation of ancient items, technologies, rituals, settlements and even landscape. The volume includes a series of new approaches that can foster the dialogue between archaeology and anthropology in the domain of the intangible knowledge of rural and urban communities. The role of ethnoarchaeology in the study of the intangible heritage is so far largely underexplored, and there is a considerable lack of ethnoarchaeological studies explicitly focused on the less tangible evidence of present and past societies. Fresh case studies will revitalize the theoretical debate around ethnoarchaeology and its applicability in the archaeological and heritage research in the new millennium. Over the past decade, 'intangible' has become a key word in anthropological research and in heritage management. Archaeological theories and methods regarding the explorations of the meaning and the significance of artifacts, resources, and settlement patterns are increasingly focusing on non-material evidence. Due to its peculiar characteristics, ethnoarchaeology can effectively foster the development of the study of the intangible cultural heritage of living societies, and highlight its relevance to the study of those of the past.

This is a startling window into the education of American doctors in the late 19th and early 20th centuries-on both a visceral level and for its revealing cultural record. Cringe-worthy shots of medical students-bare-handed gentlemen and a few ladies in street

clothes show off their scalpels, saws and textbooks-while their cadavers, mostly poor and black, are awkwardly posed, and exposed. In one stunning shot, a black woman looks out from behind the young students. "What are we to make of an African-American woman, standing, broom handle in hand, behind the dissection table, her gaze fixed on the camera?" the authors ask. More importantly, they conclude, the photo is now drawn "out of the shadows of history" where "we can at least bear witness." A blood-soaked dissection table makes you want to look away and the dark humor of students playing pranks with skeletons are both hilarious and horrible. Postcards sent to family and friends must have caused shock and awe for postmen and recipient alike. Here, a difficult glance into medicine's "uncomfortable past" offers a grand opportunity to understand the legacy doctors and patients live with, and benefit from, today. *Delineating Organs at Risk in Radiation
Therapy* Saunders

The fundamental concepts of fractal geometry and chaotic dynamics, along with the related concepts of multifractals, self-similar time series, wavelets, and self-organized criticality, are introduced in this book, for a broad range of readers interested in complex natural phenomena. Now in a greatly expanded, second edition, this book relates fractals and chaos to a variety of geological and geophysical applications. All concepts are introduced at the lowest possible level of mathematics consistent with their understanding, so that the reader requires only a background in basic physics and mathematics.

Encyclopaedia of Occupational Health

and Safety: Hazards Springer Science & Business Media

Marine Animal Forests (MAFs) are spread all over the world. Composed by suspension feeding organisms (e.g. corals, gorgonians, sponges, bryozoans, bivalves, etc.), MAFs constitute a vast number of marine ecosystems such as coral reefs, cold water corals, sponge grounds, bivalve beds, etc. The surface covered by these systems is prominent (at the scale of the oceans of the planet), though poorly known. In a previous book (*Marine Animal Forests, the ecology of benthic biodiversity hotspots*), several aspects of the MAFs were described and discussed, building the basis for a holistic approach with the aim of putting these shallow and deep sea ecosystems under a common umbrella. The main target of the present book is to identify and address important topics which were not covered in the previous three volumes. Bryozoans or Polychaeta, for example, are treated in this volume, as well as hydrothermal vents ecosystems and submarine caves, the chemical ecology in MAFs or the nursery effect on these ecosystems. The vastity of the MAF concept opens new insights in the biology, physiology, biodiversity of the organisms structuring these highly biodiverse ecosystems and on the dangers threatening them (such as microplastics or the role of invasive species as an impact of their trophic ecology or distribution). In a fast changing world, in which the complexity of MAFs is at risk, we propose an in-depth analysis of many aspects that may be inspirational for future research lines in marine biology and ecology.

Dissection L'Erma Di Bretschneider

Since the "cultural turn" in the 1990s, increasing attention has been paid to ideological concerns and gender issues

in relation to translation studies. This volume is a further illustration of this trend and focuses on the intersection of translation theory and practice with ideological constraints and gender issues in a variety of cross-cultural, geographical and historical contexts. The book is divided into three parts, with the first devoted to the health sciences, examining gender bias in medical textbooks, and the language and sociocultural barriers involved in obtaining health services in Morocco. The second part addresses the interaction of the three themes on the representation of gender and the construction of the female image both in diverse narrative texts and the presence of women in the translation of poetic works in Franco's Spain. Finally, Part Three explores editorial policies and translator ethics in relation to feminist writing or translation in the context of Europe with special reference to Italy, and in the world of magazines aimed at a female readership.

Micro-computed Tomography (micro-CT) in Medicine and Engineering Springer Science & Business Media

Defining organs at risk is a crucial task for radiation oncologists when aiming to optimize the benefit of radiation therapy, with delivery of the maximum dose to the tumor volume while sparing healthy tissues. This book will prove an invaluable guide to the delineation of

organs at risk of toxicity in patients undergoing radiotherapy. The first and second sections address the anatomy of organs at risk, discuss the pathophysiology of radiation-induced damage, and present dose constraints and methods for target volume delineation. The third section is devoted to the radiological anatomy of organs at risk as seen on typical radiotherapy planning CT scans, with a view to assisting the radiation oncologist to recognize and delineate these organs for each anatomical region – head and neck, mediastinum, abdomen, and pelvis. The book is intended both for young radiation oncologists still in training and for their senior colleagues wishing to reduce intra-institutional variations in practice and thereby to standardize the definition of clinical target volumes.

Muscle Receptors Springer Science & Business Media

Rotating flow is critically important across a wide range of scientific, engineering and product applications, providing design and modeling capability for diverse products such as jet engines, pumps and vacuum cleaners, as well as geophysical flows. Developed over the course of 20 years' research into rotating fluids and associated heat transfer at the University of Sussex Thermo-Fluid Mechanics Research Centre (TFMRC), Rotating Flow is an indispensable reference and resource for all those working within the gas turbine and rotating machinery industries. Traditional fluid and flow dynamics titles offer the essential background but generally include very sparse coverage of rotating flows—which is where this book comes in. Beginning with an accessible introduction to rotating flow, recognized expert Peter Childs takes you through fundamental equations, vorticity

and vortices, rotating disc flow, flow around rotating cylinders and flow in rotating cavities, with an introduction to atmospheric and oceanic circulations included to help deepen understanding. Whilst competing resources are weighed down with complex mathematics, this book focuses on the essential equations and provides full workings to take readers step-by-step through the theory so they can concentrate on the practical applications. A detailed yet accessible introduction to rotating flows, illustrating the differences between flows where rotation is significant and highlighting the non-intuitive nature of rotating flow fields. Written by world-leading authority on rotating flow, Peter Childs, making this a unique and authoritative work. Covers the essential theory behind engineering applications such as rotating discs, cylinders, and cavities, with natural phenomena such as atmospheric and oceanic flows used to explain underlying principles. Provides a rigorous, fully worked mathematical account of rotating flows whilst also including numerous practical examples in daily life to highlight the relevance and prevalence of different flow types. Concise summaries of the results of important research and lists of references included to direct readers to significant further resources.

Translation, Ideology and Gender Routledge

Interest in studying the phenomena of convective heat and mass transfer between an ambient fluid and a body which is immersed in it stems both from fundamental considerations, such as the development of better insights into the nature of the underlying physical processes which take place, and from practical considerations, such as the fact that these idealised configurations serve

as a launching pad for modelling the analogous transfer processes in more realistic physical systems. Such idealised geometries also provide a test ground for checking the validity of theoretical analyses. Consequently, an immense research effort has been expended in exploring and understanding the convective heat and mass transfer processes between a fluid and submerged objects of various shapes. Among several geometries which have received considerable attention are plates, circular and elliptical cylinders, and spheres, although much information is also available for some other bodies, such as corrugated surfaces or bodies of relatively complicated shapes. The book is a unified progress report which captures the spirit of the work in progress in boundary-layer heat transfer research and also identifies potential difficulties and areas for further study. In addition, this work provides new material on convective heat and mass transfer, as well as a fresh look at basic methods in heat transfer. Extensive references are included in order to stimulate further studies of the problems considered. A state-of-the-art picture of boundary-layer heat transfer today is presented by listing and commenting also upon the most recent successful efforts and identifying the needs for further research.

The Developing Mind, Second Edition
Cambridge University Press

Palaeopathology is designed to help bone specialists with diagnosis of diseases in skeletal assemblages. It suggests an innovative method of arriving at a diagnosis in the skeleton by applying what are referred to as 'operational definitions'. The aim is to ensure that all those who study bones will use the same criteria for diagnosing

disease, which will enable valid comparisons to be made between studies. This book is based on modern clinical knowledge and provides background information so that those who read it will understand the natural history of bone diseases, and this will enable them to draw reliable conclusions from their observations. Details of bone metabolism and the fundamentals of basic pathology are also provided, as well as a comprehensive and up-to-date bibliography. A short chapter on epidemiology provides information on how best to analyze and present the results of a study of human remains. *The Primo Vascular System* Springer Nature

Intended as a resource for those who have responsibilities to safeguard workers' health and safety, especially in developing countries. Covers the fields of toxicology, occupational hygiene, occupational cancer, occupational diseases of agricultural workers, occupational safety, psycho-social problems and institutions and organizations active in the field of occupational health and safety.

Children in Antiquity Springer Science & Business Media

Daniel J. Siegel goes beyond the nature and nurture divisions that traditionally have constrained much of our thinking about development, exploring the role of interpersonal relationships in forging key connections in the brain. He presents a groundbreaking new way of thinking about the emergence of the human mind and the process by which each of us becomes a feeling, thinking, remembering individual. Illuminating how and why neurobiology matters. New to This Edition *Incorporates significant scientific and technical advances.

*Expanded discussions of cutting-edge

topics, including neuroplasticity, epigenetics, mindfulness, and the neural correlates of consciousness. *Useful pedagogical features: pull-outs, diagrams, and a glossary. *Epilogue on domains of integration--specific pathways to well-being and therapeutic change.

Mappa. Pisa in the Middle Ages Mdpi AG
Gendered and sexual identities are unstable constructions which reveal a great deal about the ideologies and power relationships affecting individuals and societies. The interaction between gender/sex studies and translation studies points to a fascinating arena of discursive conflict in which our intimate desires and identities are established or rejected, (re)negotiated or censored, sanctioned or tabooed. This volume explores diverse and heterogeneous aspects of the manipulation of gendered and sexual identities. Contributors

examine translation as a feminist practice and/or theory; the importance of gender-related context in translation; the creation of a female image of secondariness through dubbing and state censorship; attempts to suppress the blatantly patriarchal and sexist references in the German dubbed versions of James Bond films; the construction of national heroism and national identity as male preserve; the enactment of Chamberlain's 'gender metaphors' in Scliar and Calvino; the transformation of Japanese romance fiction through Harlequin translations; the translations of the erotic as site for testing the complex rewriting(s) of identity in sociohistorical term; and the emergence of NRTs (New Reproductive Technologies), which is causing fundamental changes in the perception of 'creativity' or 'procreation' as male domains.
