Statistical Rethinking: A Bayesian Course with Examples in R and
 Stan builds readers' knowledge of and confidence in statistical
 modeling. Reflecting the need for even minor programming in
 today's model-based statistics, the book pushes readers to
 perform step-by-step calculations that are usually automated.
 This unique computational approach ensures that readers
 understand enough of the details to make reasonable choices
 and interpretations in their own modeling work. The text presents
 generalized linear multilevel models from a Bayesian perspective,
 relying on a simple logical interpretation of Bayesian probability
 and maximum entropy. It covers from the basics of regression to
 multilevel models. The author also discusses measurement error,
 missing data, and Gaussian process models for spatial and
 network autocorrelation. By using complete R code examples
 throughout, this book provides a practical foundation for

performing statistical inference. Designed for both PhD students and seasoned professionals in the natural and social sciences, it prepares them for more advanced or specialized statistical modeling. Web Resource The book is accompanied by an R package (rethinking) that is available on the author's website and GitHub. The two core functions (map and map2stan) of this package allow a variety of statistical models to be constructed from standard model formulas.

This book contains the most sustained and serious attack on mainstream, neoclassical economics in more than forty years. Nelson and Winter focus their critique on the basic question of how firms and industries change overtime. They marshal significant objections to the fundamental neoclassical assumptions of profit maximization and market equilibrium, which they find ineffective in the analysis of technological innovation and the dynamics of competition among firms. To replace these assumptions, they borrow from biology the concept of natural selection to construct a precise and detailed evolutionary theory of business behavior. They grant that firms are motivated by profit and engage in search for ways of improving profits, but they do not consider them to be profit maximizing. Likewise, they emphasize the tendency for the more profitable firms to drive the less profitable ones out of business, but they do not focus their analysis on hypothetical states of industry equilibrium. The results of their new paradigm and analytical framework are impressive. Not only have they been able to develop more coherent and powerful models of competitive firm dynamics under conditions of growth and technological change, but their approach is compatible with findings in psychology and other social sciences. Finally, their work has important implications for welfare economics and for government policy toward industry.
