Clinical laboratory tests play an integral role in helping physicians diagnose and treat patients. New developments in laboratory technology offer the prospect of improvements in diagnosis and care, but will place an increased burden on the payment system. Medicare, the federal program providing coverage of health-care services for the elderly and disabled, is the largest payer of clinical laboratory services. Originally designed in the early 1980s, Medicare's payment policy methodology

for outpatient laboratory services has not evolved to take into account technology, market, and regulatory changes, and is now outdated. This report examines the current Medicare payment methodology for outpatient clinical laboratory services in the context of environmental and technological trends, evaluates payment policy alternatives, and makes recommendations to improve the system.

The purpose of this book to provide developing countries outside the Europe, UK and the USA, blood bank equipment that can be made in the shop at a reasonable cost. The instruments can be built in trade schools, colleges by the Bio-Engineer and even in the home shop. Many of the instruments shown in this book cost thousands of dollars retail but can be built for less than \$50.00 in parts. The instruments have been proven and published in several electronics magazines and journals. Many are being used in developing countries presently. This book is compiled of both published items and other writings of the author. This book comes with a CD which can be downloaded. Costs in Blood banking and medicine in the United States has sky rocketed. The cost of a CBC in 1960 was \$8.00 and now it is not uncommon to pay \$80.00. CBCs back then were all manual labor and now they are fully automated. Increasing costs have been caused by malpractice suits and regulations. E.g., the "Shorty" (see chapter five) is a device that weighs blood while a phlebotomy is being performed. The part cost is about \$100.00 (\$85.00 for the load cell alone). I sold my rights to this device in the year 2000. It is now manufactured and sells for \$3,000 ea and is one of the leading blood bank scales. Please keep in mind, that none of these devices have been approved by CE standards or by the FDA and are used at your own risk.

Mollison's *Blood Transfusion in Clinical Medicine* is an icon in the field of transfusion and the first edition was published in 1951. The book arose from the concept of the transfusionist, as both scientist and expert consultant. For many years, this text has provided the primary, and often the sole, reference for detailed information and practical experience in blood transfusion. The book is completely revised and updated throughout to include the latest advances and developments in the field.
