### A Power User's Guide Apress

Recent changes in technology scaling have made power dissipation today's major performance limiter. As a result, designers struggle to meet performance requirements under stringent power budgets. At the same time, the traditional solution to power efficiency, application specific designs, has become prohibitively expensive due to increasing nonrecurring engineering (NRE) costs. Most concerning are the development costs for design, validation, and software for new systems. In this thesis, we argue that one can harness ideas of reconfigurable designs to build a design framework that can generate semi-custom chips --- a Chip Generator. A domain specific chip generator codifies the designer knowledge and design trade-offs into a template that can be used to create many different chips. Like reconfigurable designs, these systems fix the top level system architecture, amortizing software and validation and design costs, and enabling a rich system simulation environment for application developers. Meanwhile, below the top level, the developer can "program" the individual inner components of the architecture. Unlike reconfigurable chips, a generator "compiles" the program to create a customized chip. This compilation process occurs at elaboration time --- long before silicon is fabricated. The result is a framework that enables more customization of the generated chip at the architectural level, because additional components and logic can be added if the customization process requires it. At the same time this framework does not introduce inefficiency at the circuit level because unneeded circuit overheads are not taped out. Using Chip Generators, we argue, will enable design houses to design a wide family of chips using a cost structure similar to that of designing a single chip --- potentially saving tens of millions of dollars --- while enabling per-application customization and optimization.

Among the many different approaches to "templating" with Perl--such as Embperl, Mason, HTML::Template, and hundreds of other lesser known systems--the Template Toolkit is widely recognized as one of the most versatile. Like other templating systems, the Template Toolkit allows programmers to embed Perl code and custom macros into HTML documents in order to create customized documents on the fly. But unlike the others, the Template Toolkit is as facile at producing HTML as it is at producing XML, PDF, or any other output format. And because it has its own simple templating language, templates can be written and edited by people who don't know Perl. In short, the Template Toolkit combines the best features of its competitors, with ease-of-use and flexibility, resulting in a technology that's fast, powerful and extensible, and ideally suited to the production and maintenance of web content and other dynamic document systems. In Perl Template Toolkit you'll find detailed coverage of this increasingly popular technology. Written by core members of the technology's development team, the book guides you through the entire process of installing, configuring, using, and extending the Template Toolkit. It begins with a fast-paced but thorough tutorial on building web content with the Template Toolkit, and then walks you through

generating and using data files, particularly with XML. It also provides detailed information on the Template Toolkit's modules, libraries, and tools in addition to a complete reference manual. Topics in the book include: Getting started with the template toolkit The Template language Template directives Filters Plugins Extending the Template Toolkit Accessing databases XML Advanced static web page techniques Dynamic web content and web applications The only book to cover this important tool, Perl Template Toolkit is essential reading for any Perl programmer who wants to create dynamic web content that is remarkably easy to maintain. This book is your surefire guide to implementing this fast, flexible, and powerful templating system.

Business Process Management and Workflow are, by their very nature, social activities. The collaboration and communication patterns that are now increasingly referred to as "social computing" were also fundamental to the BPM and workflow models of the early 1990s. Yet it has been the recent explosion of social computing and accompanying success of social production, from Linux to Wikipedia, and Facebook to Twitter, which have had the most dramatic impact on collaboration in business environments. Today we see the transformation of both the look and feel of BPM technologies along the lines of social media, as well as the increasing adoption of social tools and techniques democratizing process development and design. It is along these two trend lines; the evolution of system interfaces and the increased engagement of stakeholders in process improvement, that Social BPM has taken shape. Aesthetics isn't the only thing that you should be striving for when you design a template. When creating technical documentation, such as user manuals and online help systems, usability, readability, and simplicity are just as crucial. The design must please the eye and at the same time communicate the content clearly. Paragraph styles and character styles should be efficient to use

when writing the document. The layout process should be automated as much as possible. As user assistance documents are frequently updated, an automated layout process is much more important here than in other kinds of books. For example, when you insert a new paragraph into a document, this shouldn't result in you having to manually tweak all subsequent page breaks-not to mention page numbers, cross-references, the table of contents, and the index. Setting up templates and style sheets that are efficient to use when creating and updating a document requires a lot of experience in technical writing. The rules presented in this book are the essence of this experience. All chapters provide various examples that you can use for inspiration and as starting points for your own designs. Topics covered: Layout basics; Setting the type area; Choosing fonts and spacing; Avoiding manual formatting; Creating semantic styles; Organizing styles hierarchically; Recommended screen layouts; Recommended page layouts; Recommended table designs; Recommended paragraph styles; Recommended character styles. Audience: technical writers, developers, marketing professionals, product managers, designers.
